Soils

Highly weathered, acid soils:

- Low pH
- High Al content (toxic for plants)
- Low fertility: P, Ca, K, Mg, Zn

Soy Land: 84 Million Acres

Physiological Mechanisms associated with gains in Soy Yields

Historical gains in Soy yields (1923 to 2007):

- **PAR Interception**: canopy light interception
- **Energy Conversion (RUE)**: light energy into Biomass
- **Partitioning Efficiencies (HI)**: biomass into seed

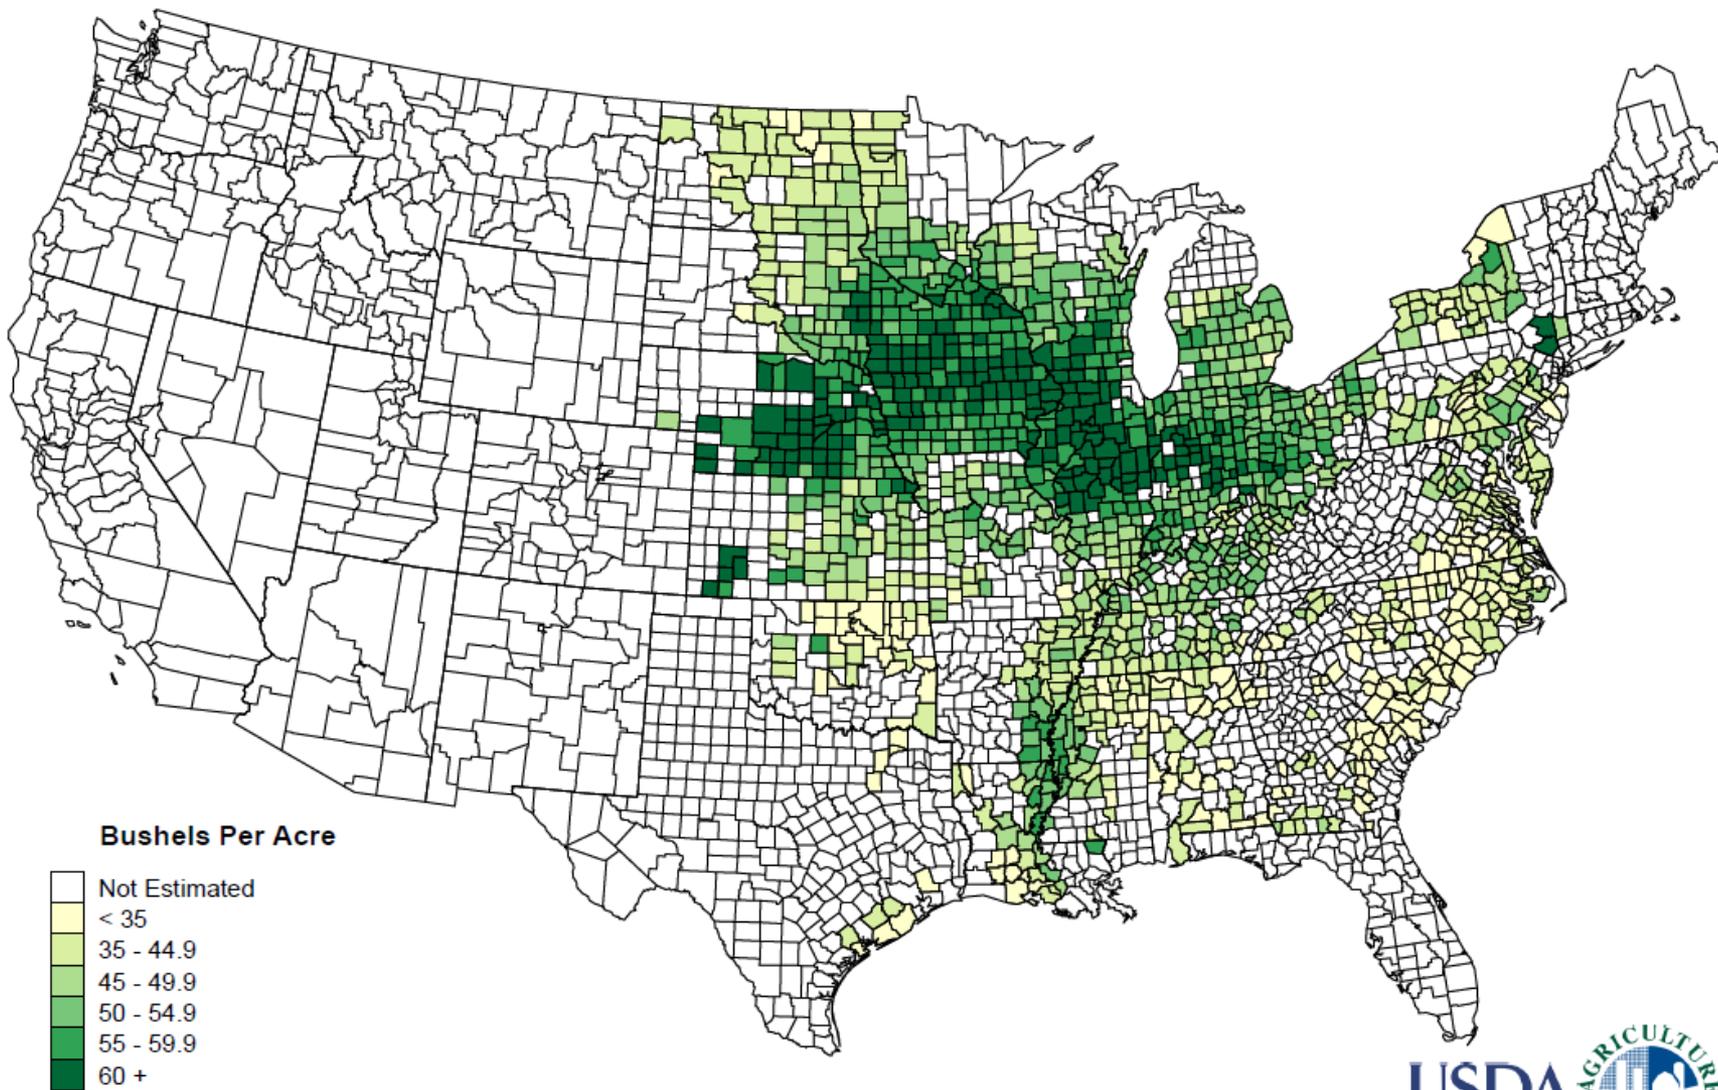

Koester et al. (2014)

Yield Potential = PAR Intercept x RUE x HI

**What is the most important
soybean yield predictor?**

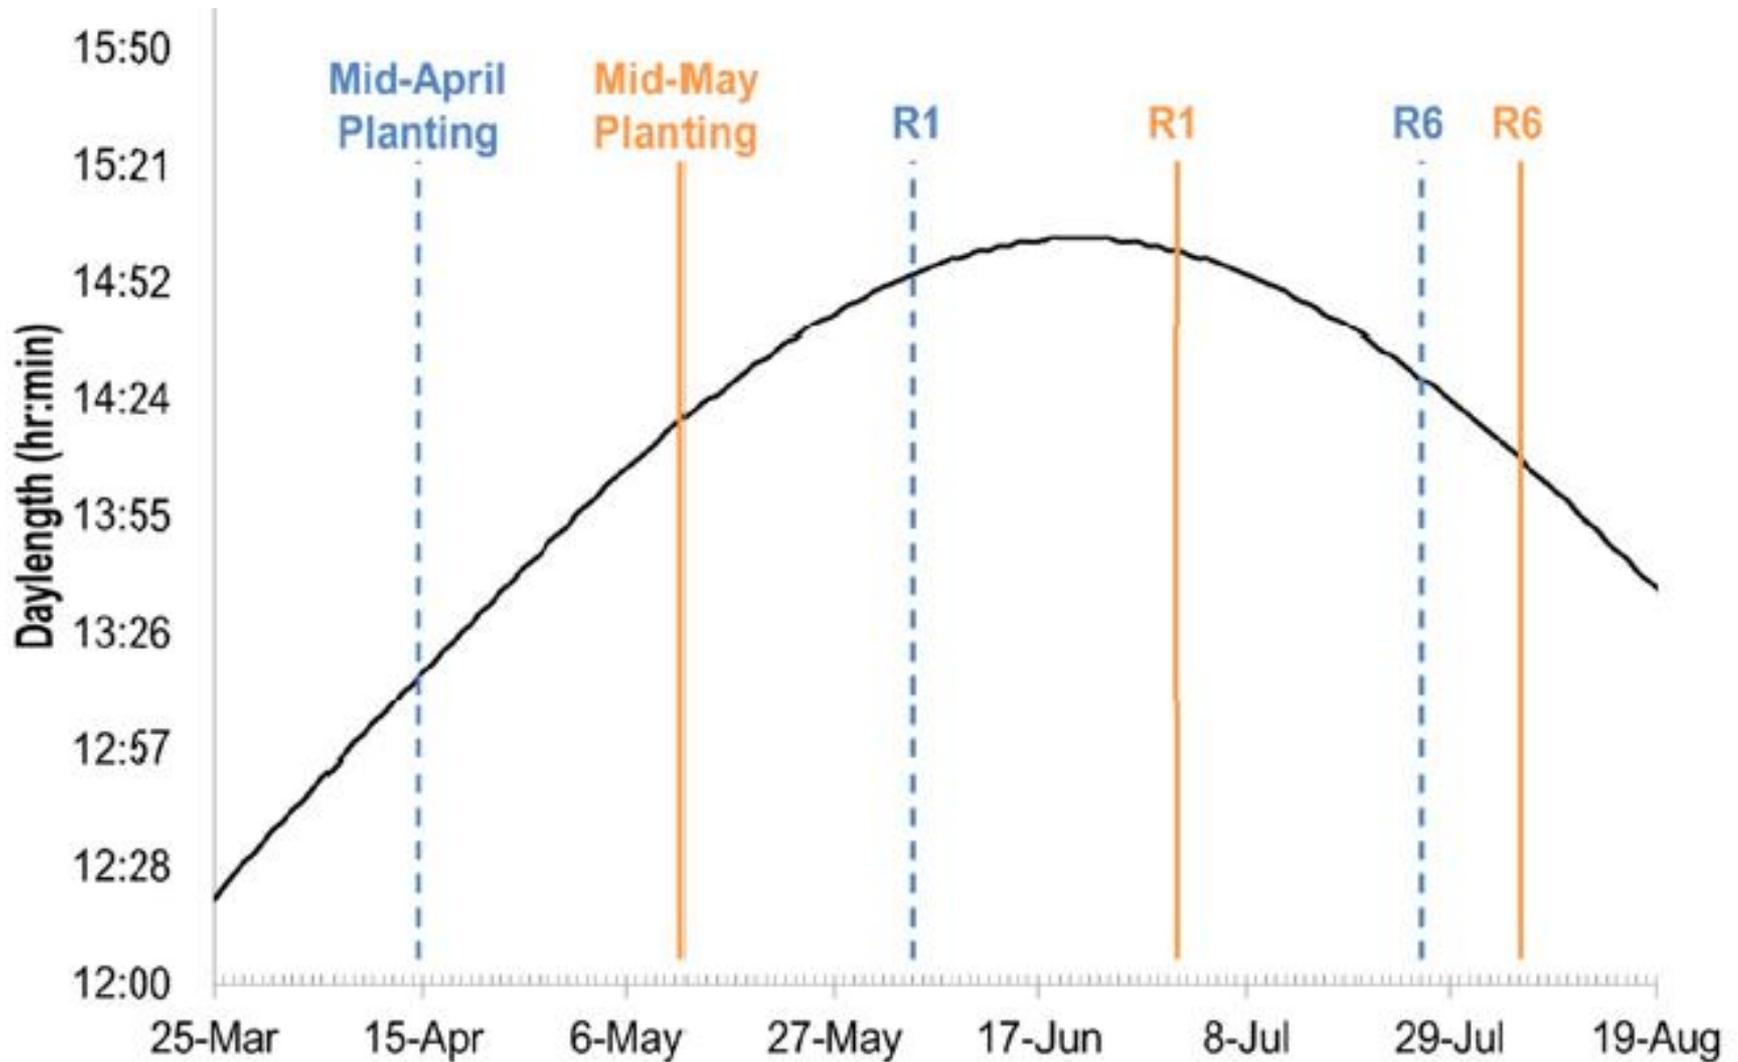

Planting Date x Yield

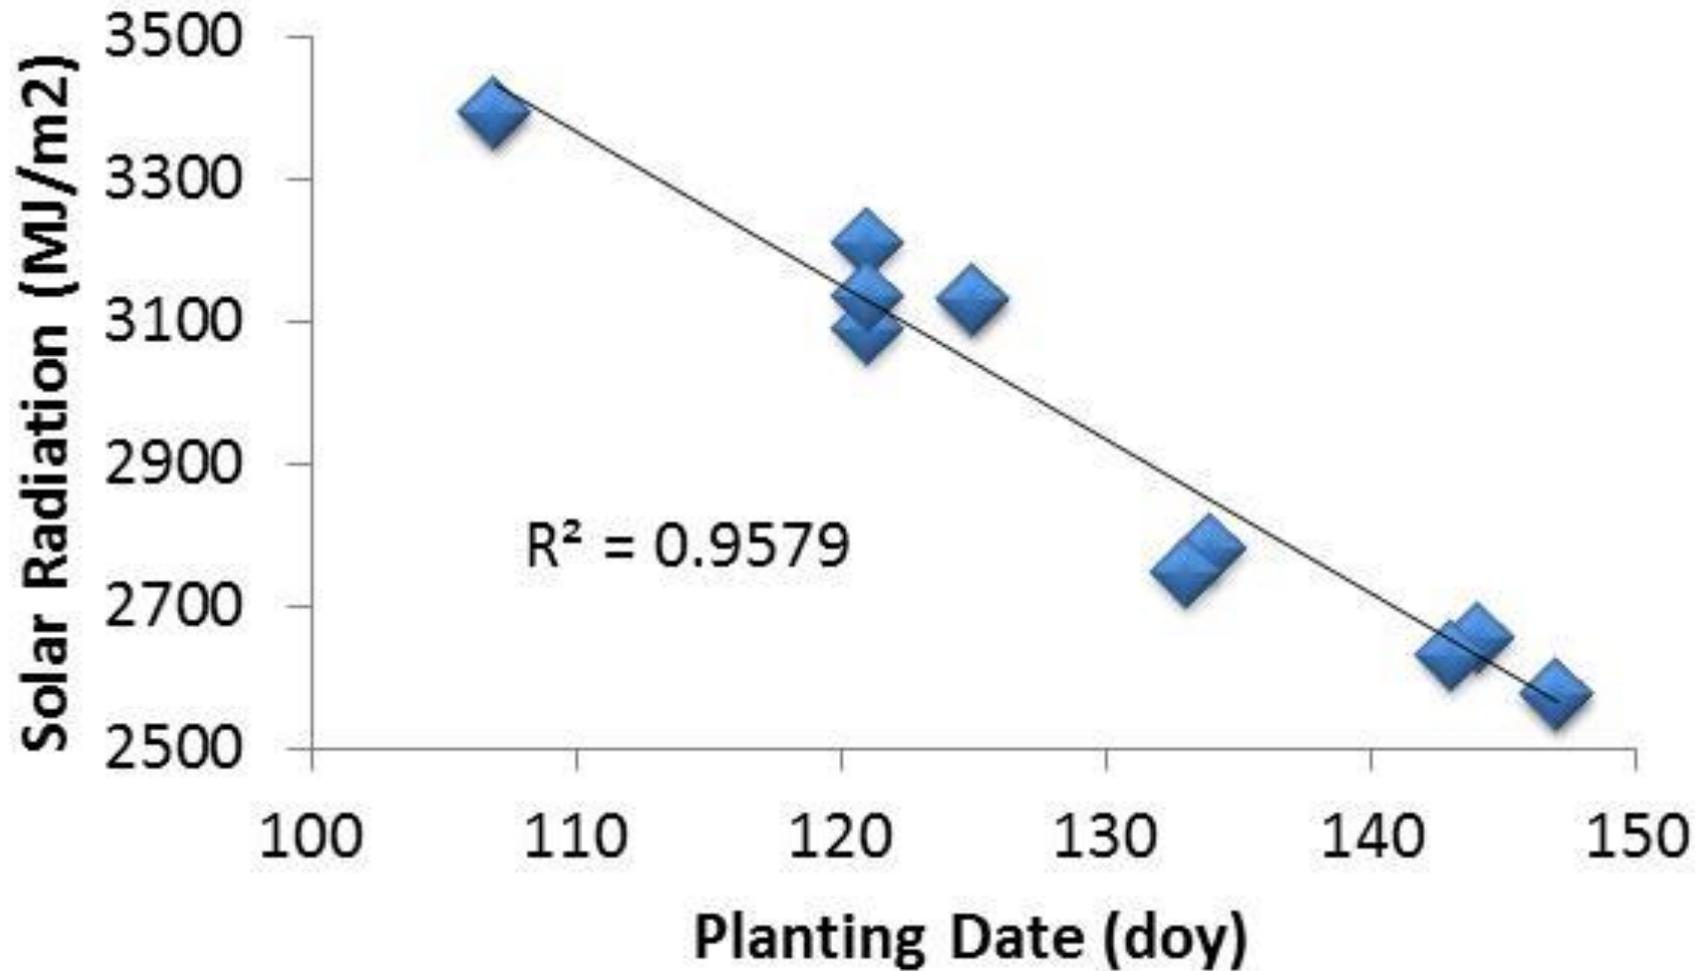

(21 Fields, 18 Planting Dates, 2016 and 2017)

Understanding and Increasing Soybean Yields

Sunlight

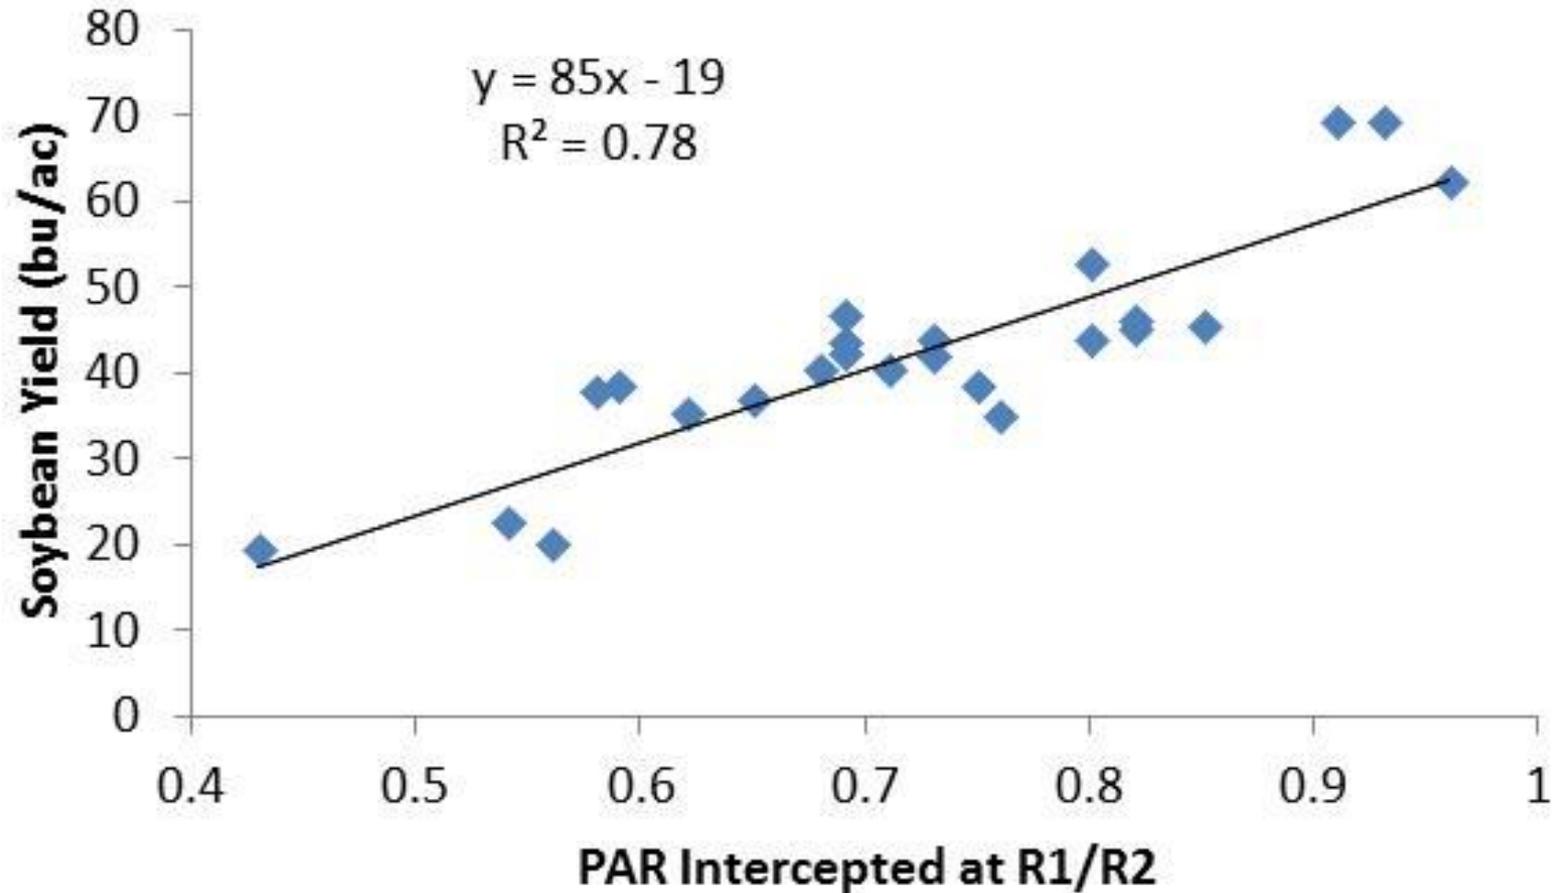

Light Interception

PAR Interception x Yield

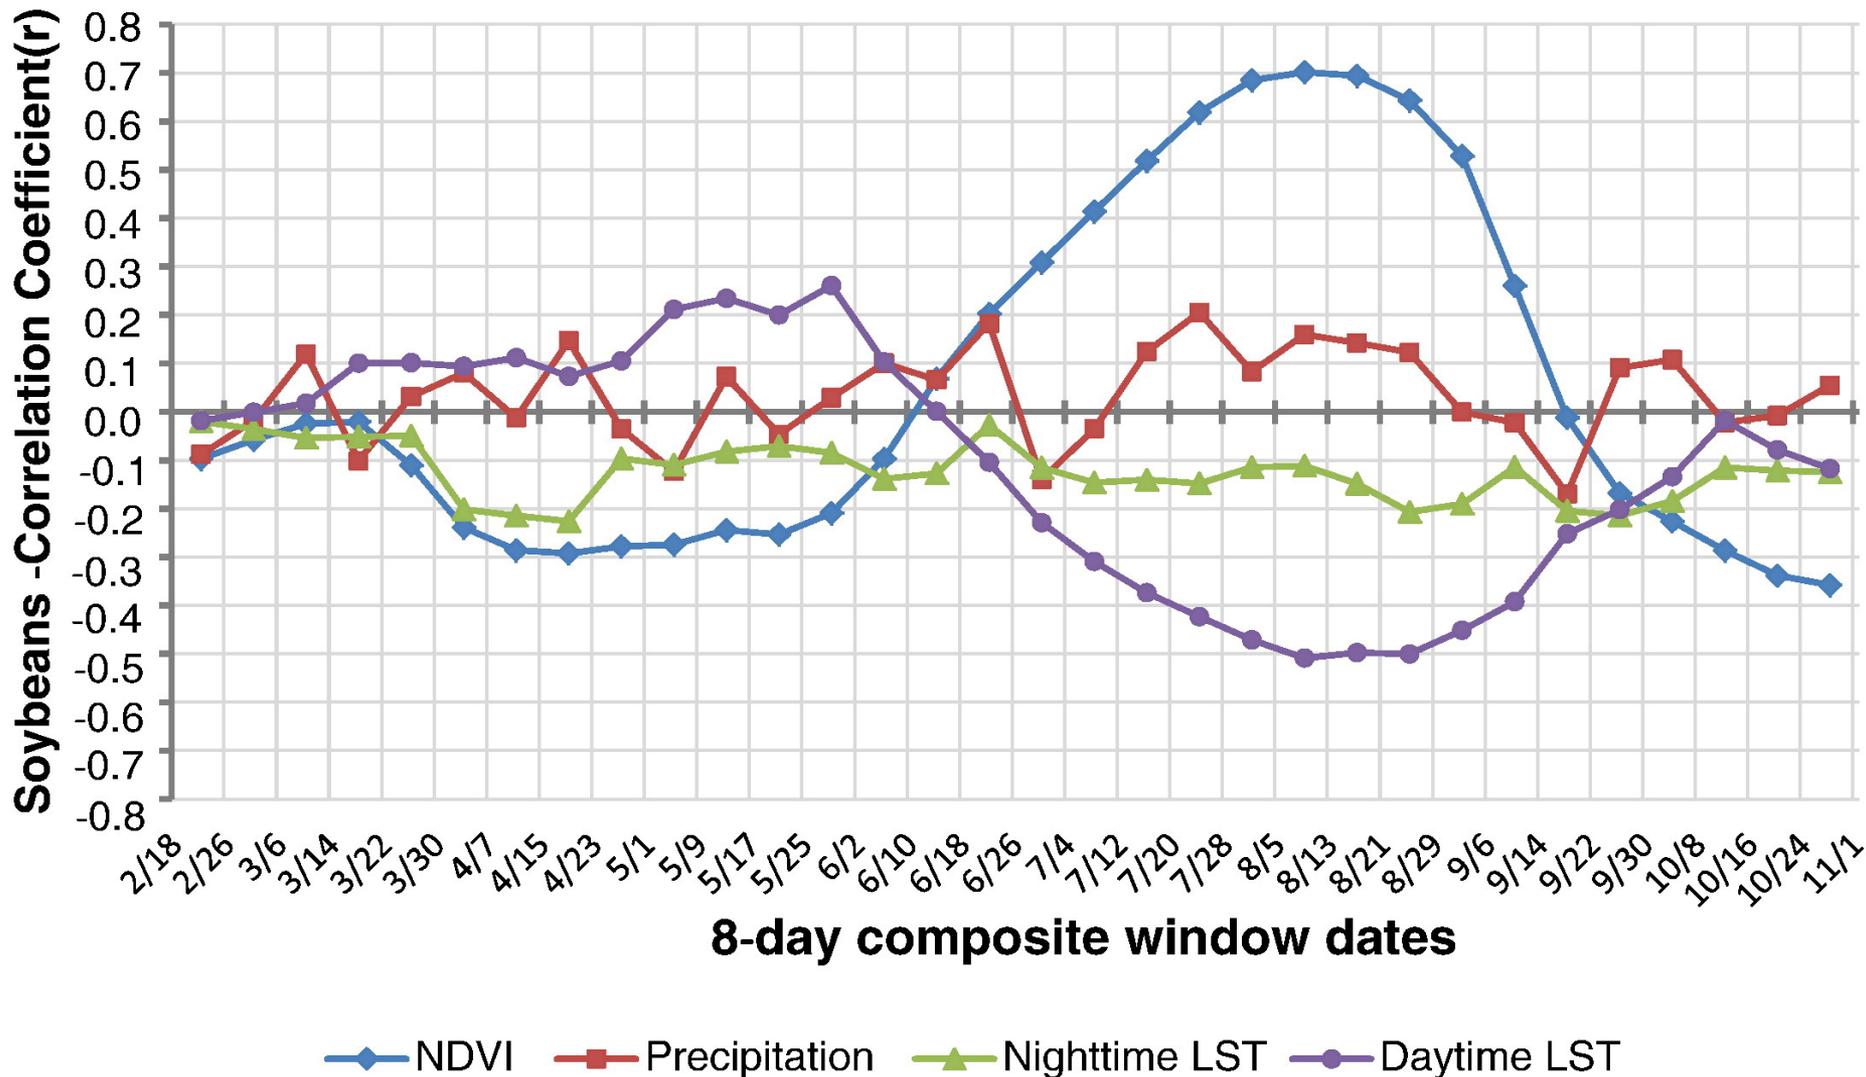

(SEAREC and Rock Springs, 2016)

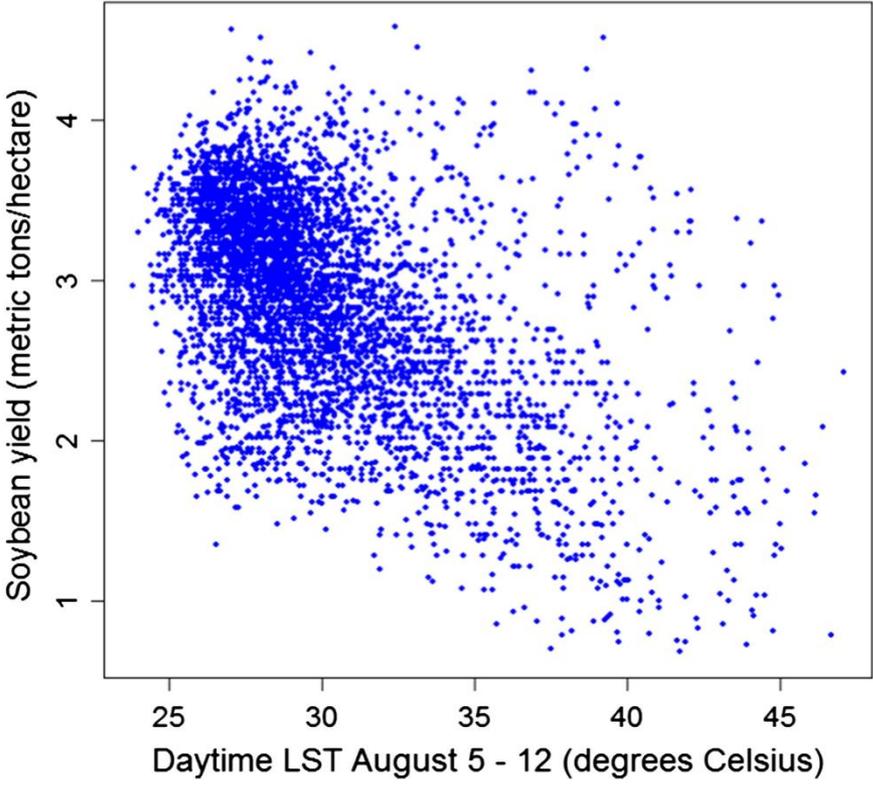

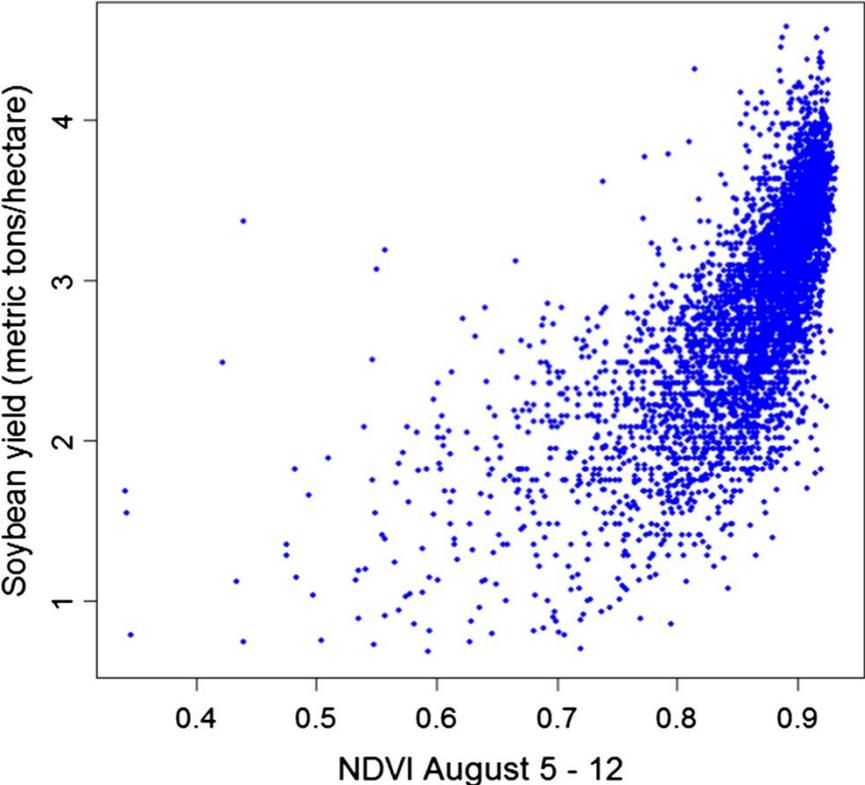

8-year average (36 – 96% range) in Rock Springs: 10% change in light interception at flowering represents an impact of ***4.4 bu/ac in soybean yield!***

Soybeans Remotely Sensed Variables Correlation by Date

Corn Belt – 2006 to 2011

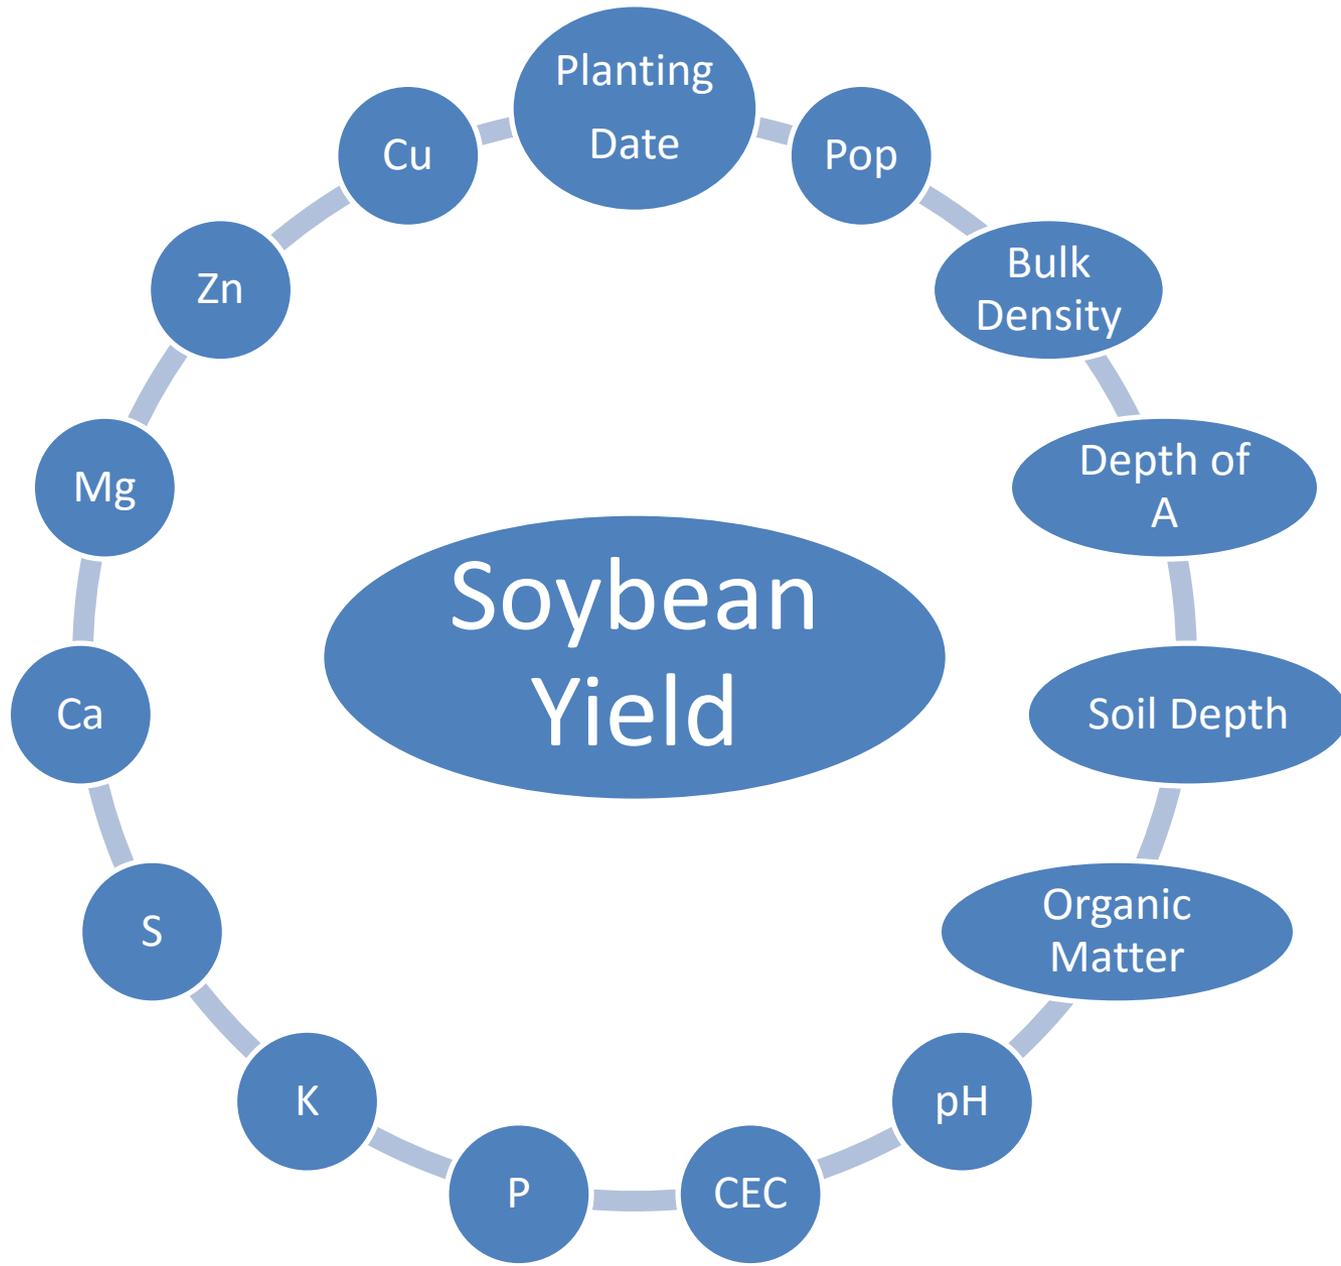

Relationship between NDVI and Surface Temperature to Yield

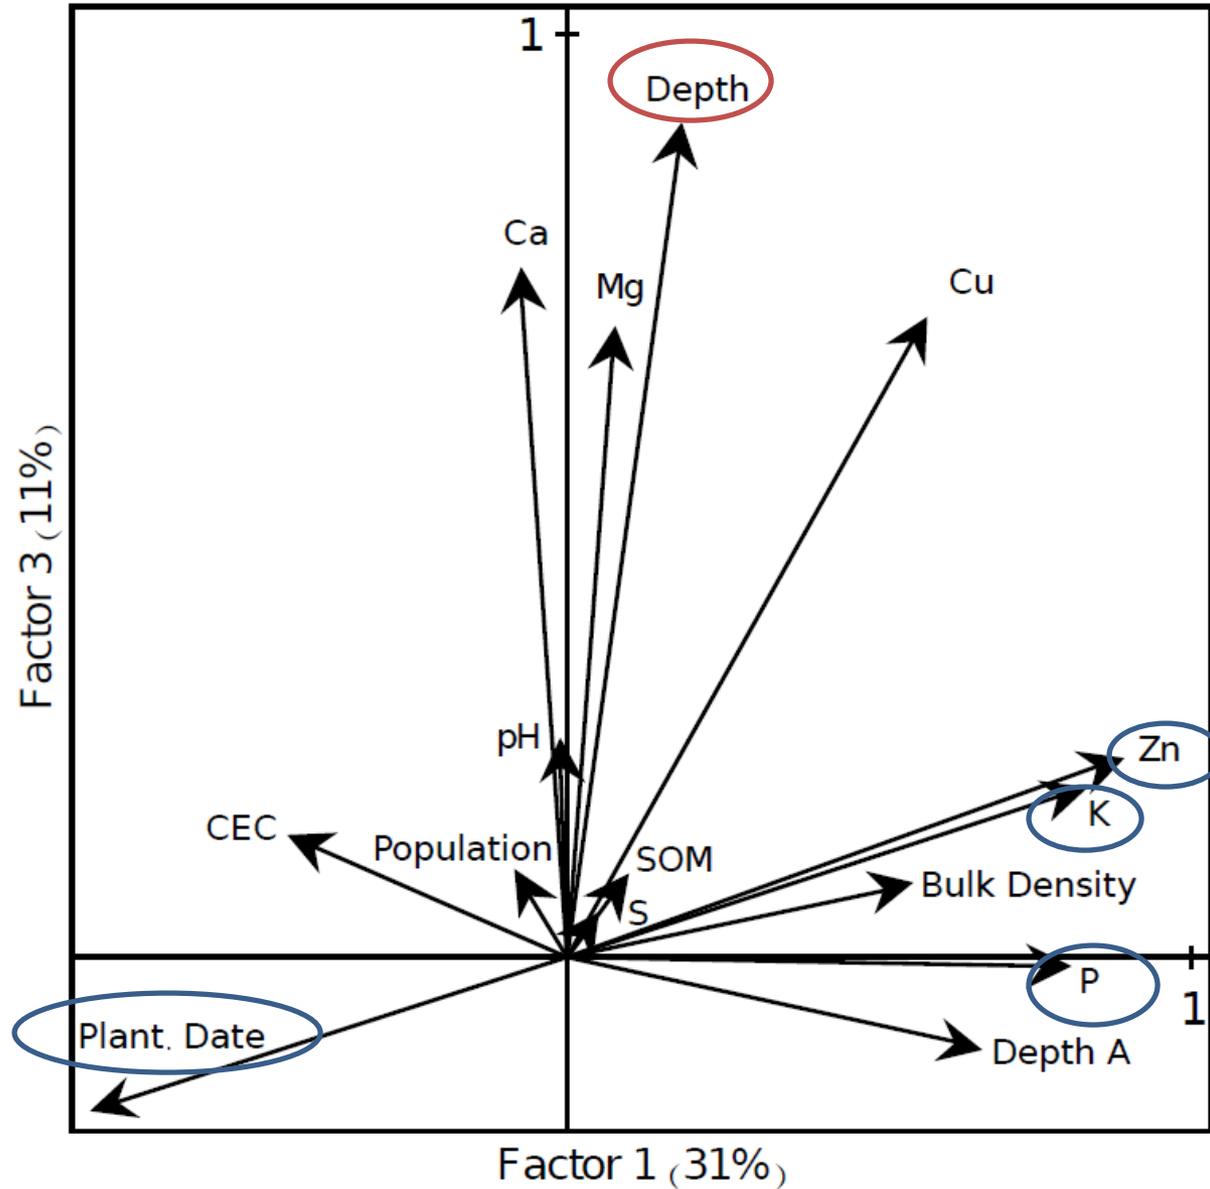

**How about the soil
variables?**

22 Fields – Centre and Lebanon

Factor x Yield – PCA Analysis

Take Home Message

- Lebanon Factor

Planting Early

Manure (P, K, Zn)

- Soil Depth

$$R^2 = 0.79$$

about soil
health...**

Comprehensive Assessment of Soil Health

From the Cornell Soil Health Laboratory, Department of Soil and Crop Sciences, School of Integrative Plant Science, Cornell University, Ithaca, NY 14853. <http://soilhealth.cals.cornell.edu>

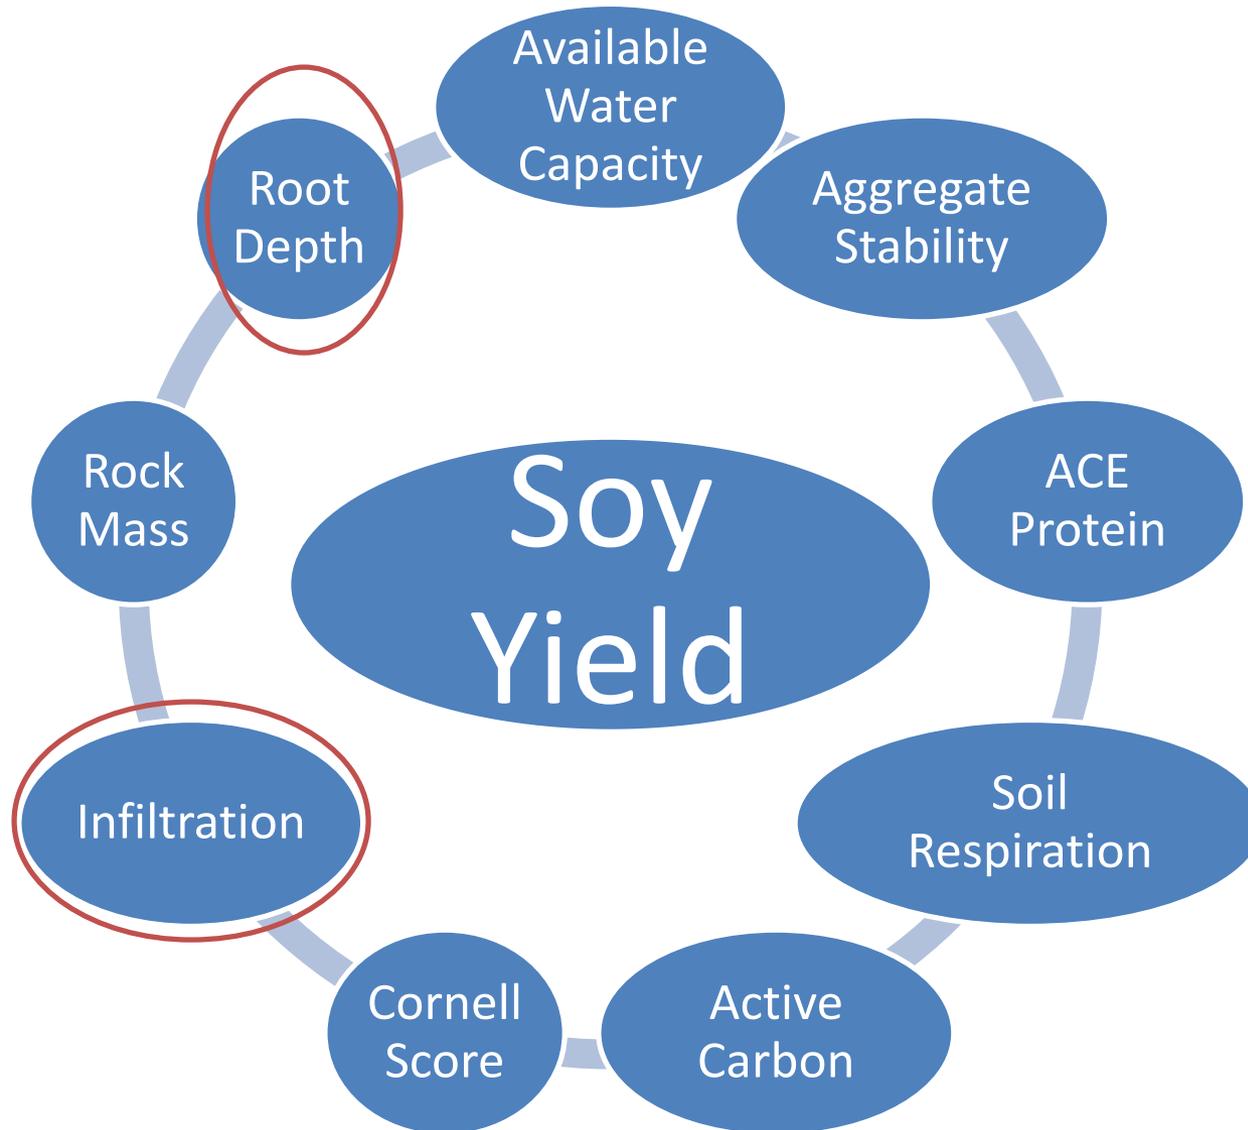

Measured Soil Textural Class: **silt loam**

Sand: **28%** - Silt: **50%** - Clay: **21%**

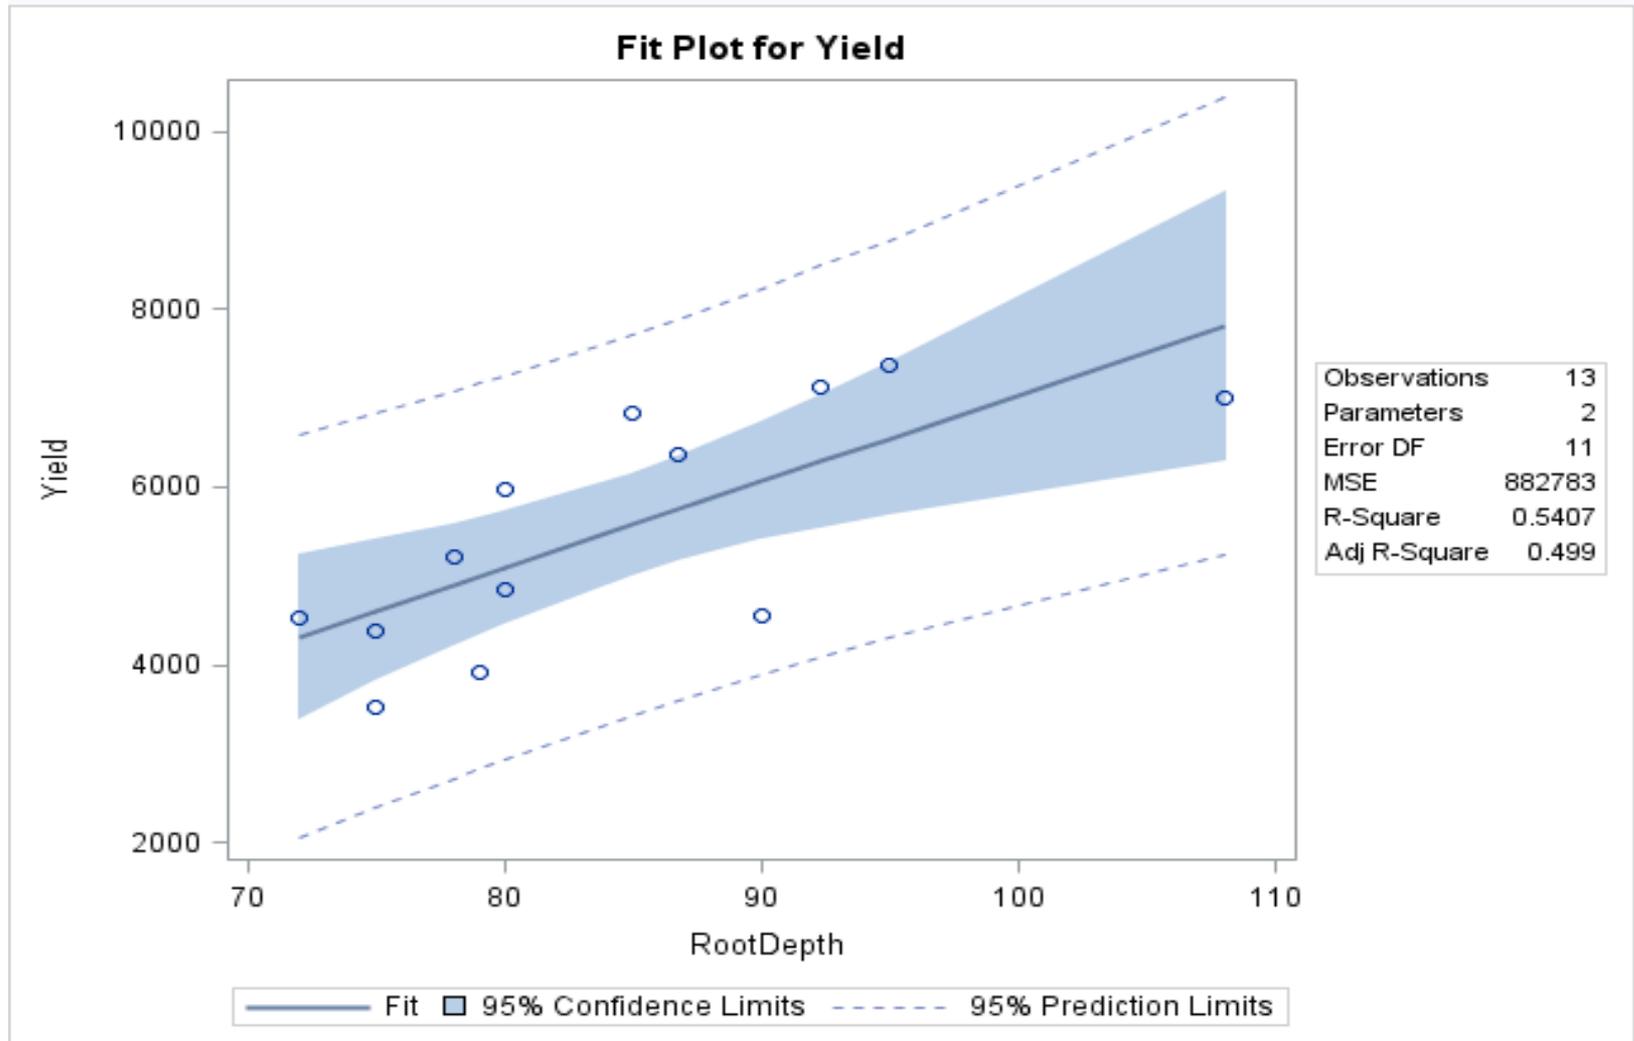

Group	Indicator	Value	Rating	Constraints
<i>physical</i>	Available Water Capacity	0.21	77	
<i>physical</i>	Surface Hardness			Not rated: No Field Penetrometer Readings Submitted
<i>physical</i>	Subsurface Hardness			Not rated: No Field Penetrometer Readings Submitted
<i>physical</i>	Aggregate Stability	16.2	20	
<i>biological</i>	Organic Matter	3.1	53	
<i>biological</i>	ACE Soil Protein Index	5.0	32	
<i>biological</i>	Soil Respiration	0.4	21	
<i>biological</i>	Active Carbon	408	31	
<i>chemical</i>	Soil pH	5.8	41	
<i>chemical</i>	Extractable Phosphorus	6.6	100	
<i>chemical</i>	Extractable Potassium	133.2	100	
<i>chemical</i>	Minor Elements Mg: 31.1 / Fe: 2.5 / Mn: 14.5 / Zn: 0.9		56	

Overall Quality Score: **53 / Medium**

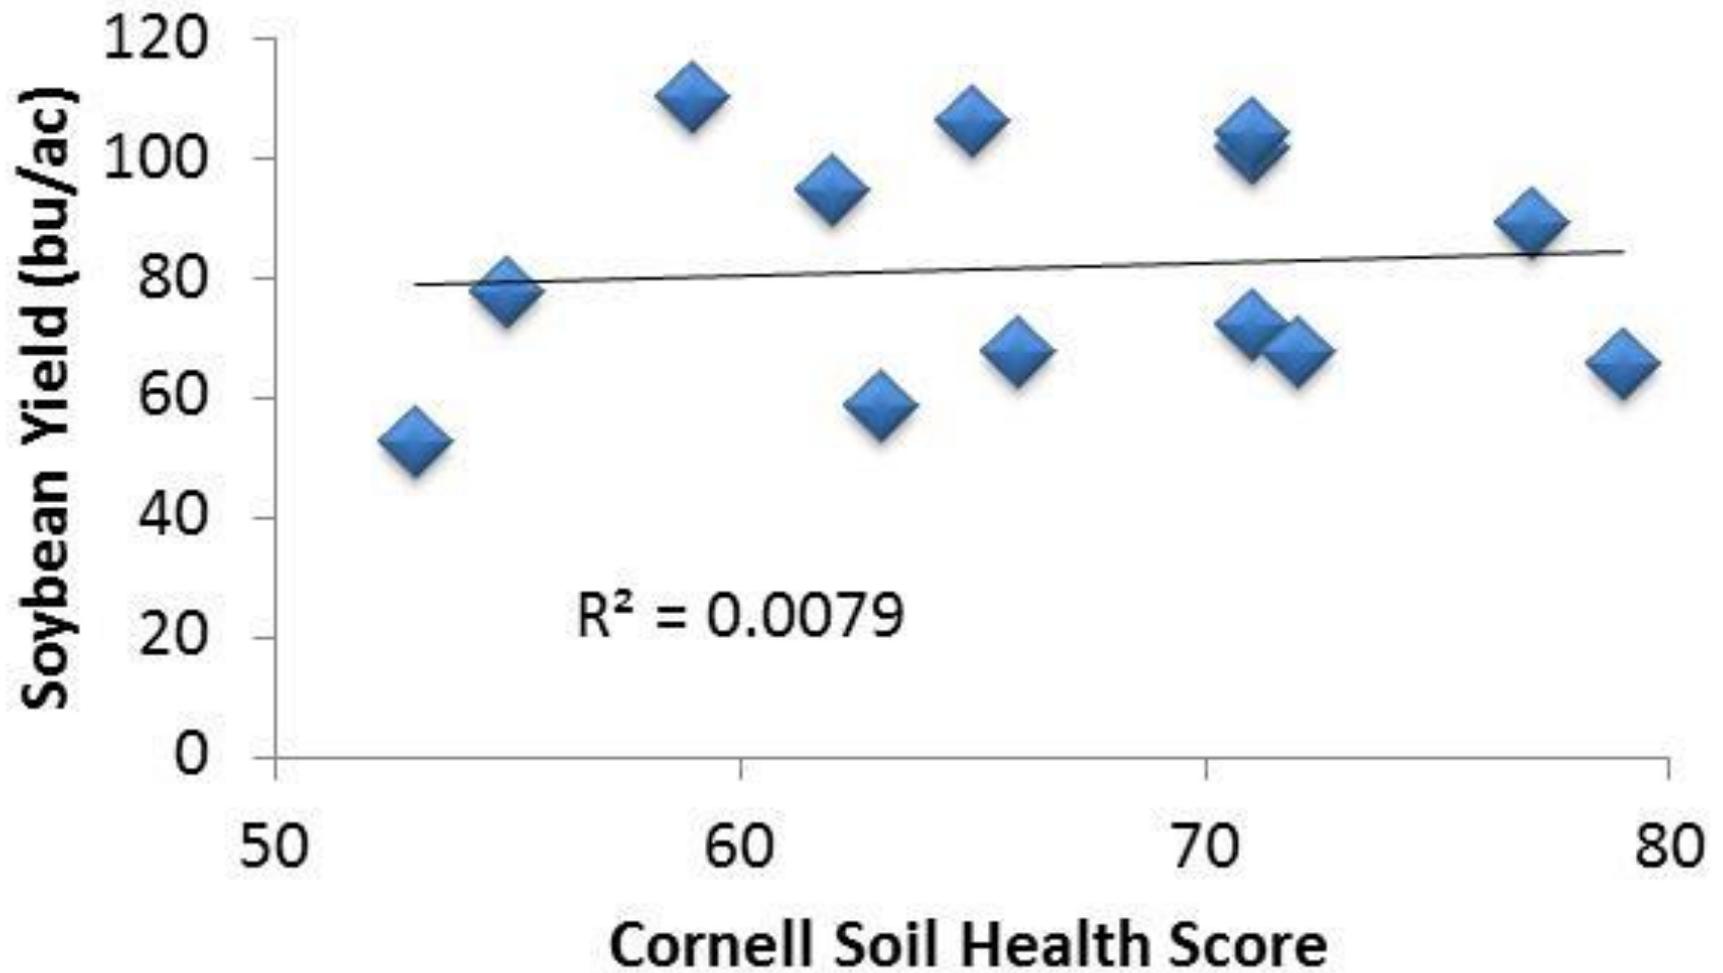

PCA (Soil Health) – 0 to 6 inches

Multiple Regression (Soil Health)

Soil Health

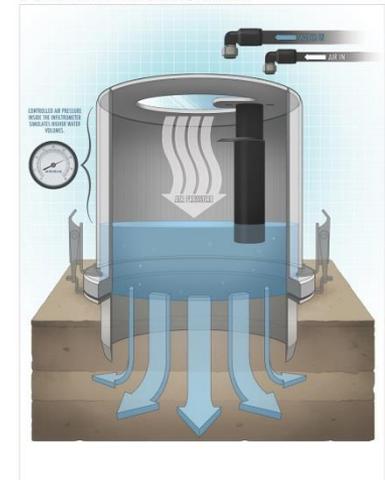

Take Home Message

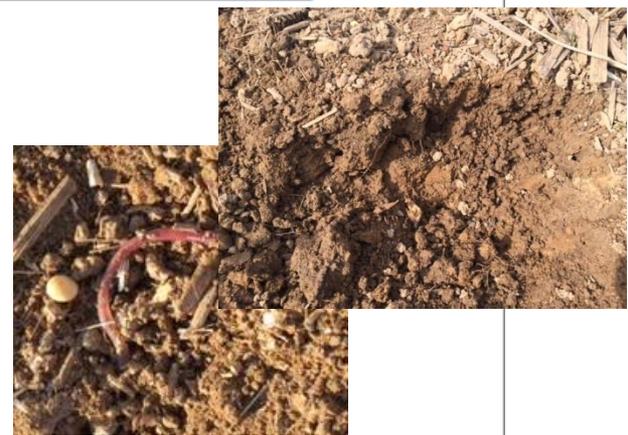

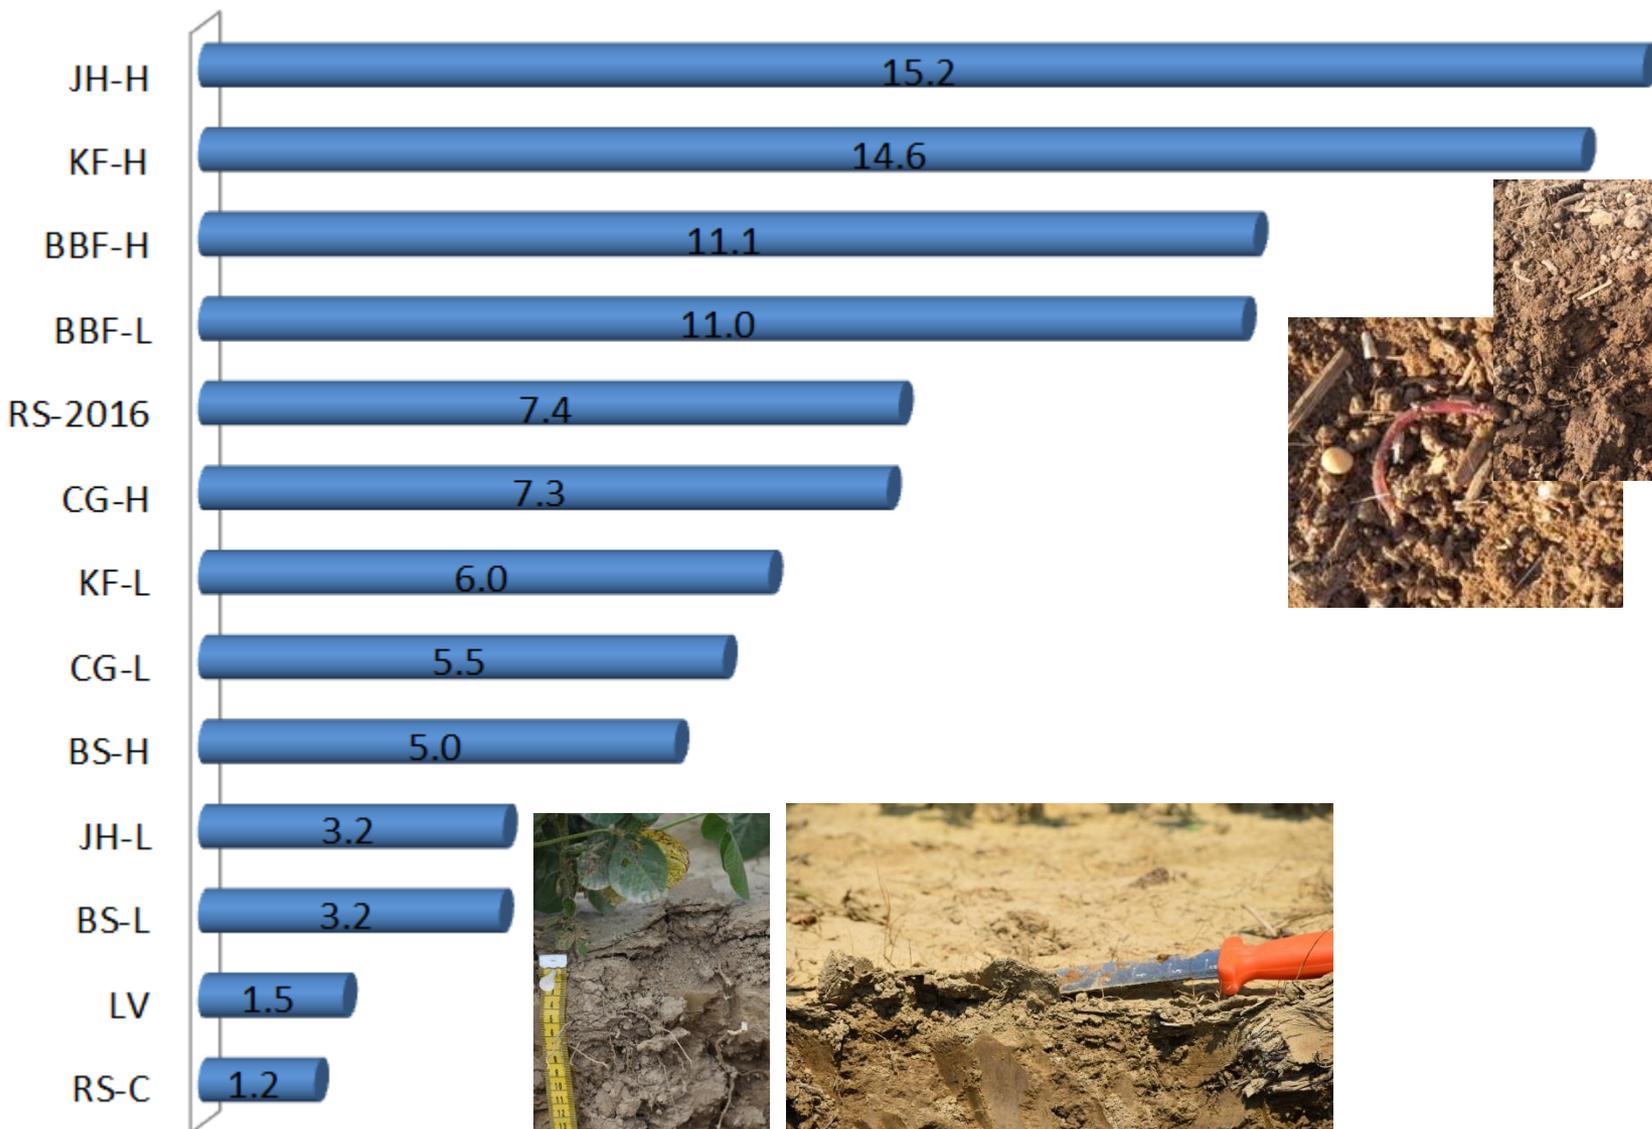

- Infiltration (ksat) and root depth are the main yield predictors, and they are related to each other;
- Root depth alone explains 54% of the soybean yield variation;
- The other soil health indicators were not good yield predictors.

DUAL-HEAD INFILTROMETER

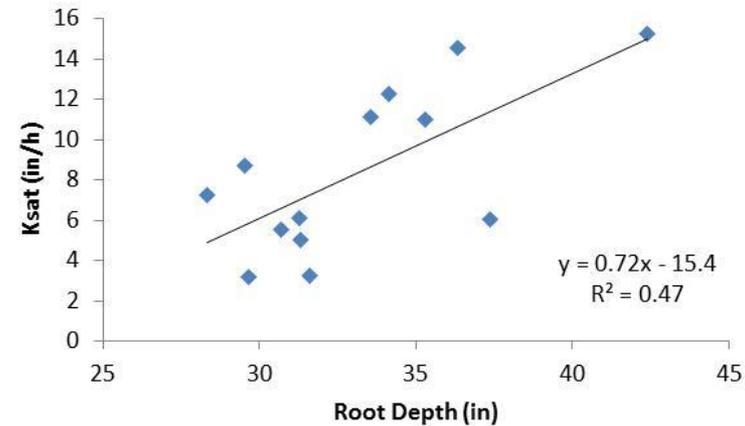

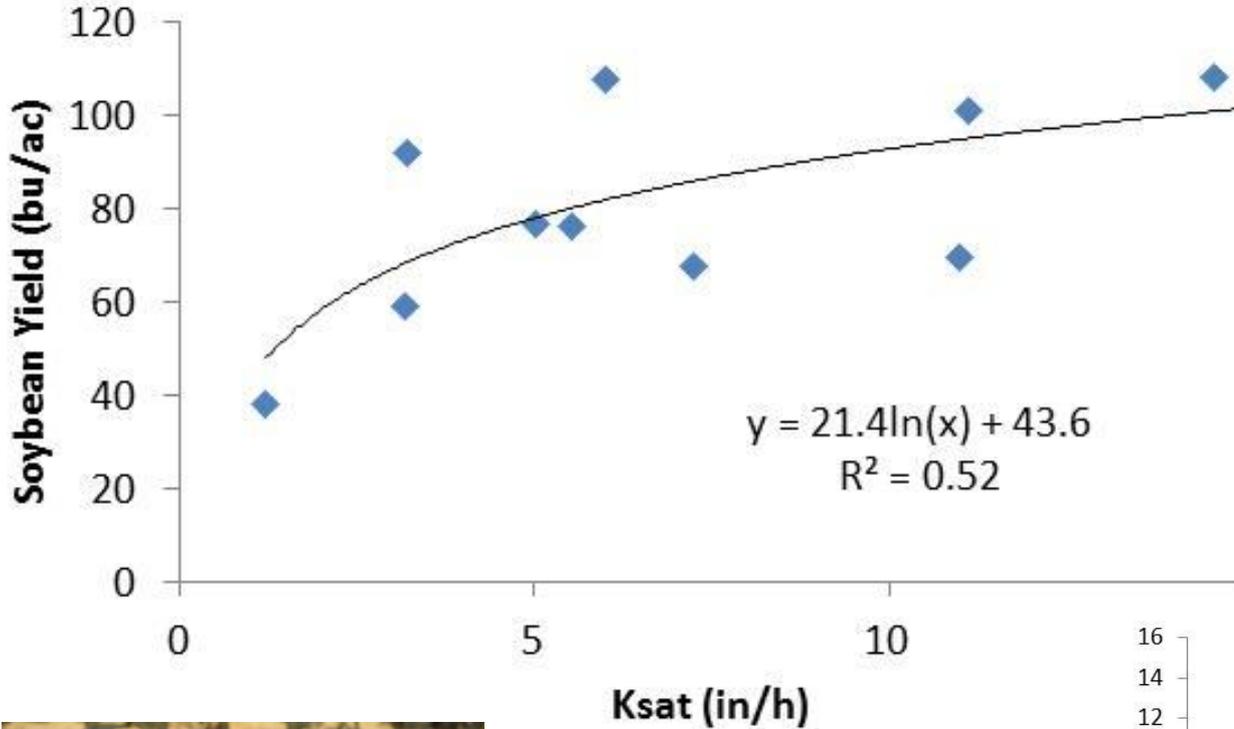

Saturated Hydraulic Conductivity (in/hour)

Infiltration

(Lebanon and Centre, 2017)

- Surface soil layers (< 2 feet):
 - 30 – 40% of roots clumped within pores and cracks;
- Subsoil (2 to 5 feet):
 - 85 - 100% in pores or cracks (44% in pores with at least 3 other roots).

Final Comments

- **Plant as early as possible** – Every day matters!
- **Focus on Light Interception at R1** - Manage population and row spacing based on your environment.
- After raising soil macro and micro to optimum levels, **focus on raising your soil infiltration levels.**
- Genotype x Soil x Climate interactions – **Understand you varieties.**

Thank You!
