

# Cornell Cooperative Extension Vegetable Program

## Using Cultural Practices to Manage Bacterial Diseases and Increase Profitability of Fresh Market Onions in the Northeast United States

**Christy Hoepting**

Judson Reid & Katie Klotzbach

Cornell Cooperative Extension Vegetable Program

Beth Gugino

Dept. of Plant Pathology, Pennsylvania State University

# Acknowledgements

- **Grower cooperators:**
  - Eli Stoltzfus, Interlaken, NY
  - Amos Lap, New Holland, PA
- **Funding provided by:**
  - NESARE Partnership Grant, 2009
  - NE-IPM Partnership Grant, 2010-2011

# Issue

- Bacterial diseases of onions are an increasing threat to small-scale diversified fresh market growers in the Northeast United States
- If bacterial diseases of onions cannot be managed this industry will not be sustained or expanded.

# Fresh Market Onions in NE US

- Expanding industry
- Small-scale intensive production
  - Grown on plastic mulch, beds 3 feet wide with drip irrigation
  - Exclusively grown from transplants: locally grown plugs, imported bare roots (TX, AZ)
  - Hand-harvested
  - 0.5 (or less) to 2.0 acres per farm
- Predominantly grown by very diversified “plain sect” farmers

# Fresh Market Onions in NE US

## Marketing

- Pennsylvania Simply Sweet Brand
- Produce Auctions (12 in PA, 4 in NY)
- Farmer's markets
- Roadside stands

# Fresh Market Onions in NE US

## PA Simply Sweet Onions:

	<b>2008</b>	<b>2010</b>	
<b>No. growers</b>	100	100+	
<b>No. acres</b>	200	300	<b>1.5x</b>
<b>Value</b>	\$1.5 million	\$2.5 million	<b>1.7x</b>

- In New York, there are 100-200 fresh market vegetable growers who grow onions.
- > \$10,000 to \$35,000 per acre

# Fresh Market Onions in NE US

## Increased market demand for fresh onions

- “Eat Local”/”locavore” craze (sell out of storage)
- In general, there is an increased demand for sweet onions grown in the Northeast U.S. as an alternative to the high costs of shipping them from the west
- PA broker has market to sell 3 times his current volume

# Bacterial Diseases of Onions

## Cause Serious Economic Losses:

- Especially in PA in sweet onions, losses of 5 to 40+ % occur regularly.
- Growers harvest 2-3 weeks early, sacrificing size to avoid bacterial bulb rot

# Bacterial Diseases of Onions

## New York

- **Sour Skin** – *Burkholderia cepacea*

## Pennsylvania

- **Center Rot** – *Pantoea agglomerans*
- **Soft Rot** - *Pectobacterium caratovora*

# Bacterial Diseases of Onions

## Others

- **Soft Rot** – *Erwinia carotovora* subsp. *carotovora*, *Pseudomonas marginalis*
- **Center Rot** – *Pantoea ananatis*
- **Leaf diseases** - *Xanthomonas axonopodis* and *Pseudomonas viridiflava*
- *Enterobacter cloaceae*

**We are dealing with a complex!**

# Bacterial Diseases of Onions

# Chemical Tactics Have Failed

- Reports in PA of weekly sprays of various bactericides (copper, Oxidate, etc.) starting as early as 5-leaf stage (mid-May) and continuing until its PHI expires
  - Resulted in 30% bacterial rot
- Bacterial diseases need to be controlled using an IPM program that incorporates cultural practices
  - Plant spacing
  - Mulch Type

How Does Plant Spacing  
Reduce Bacterial Decay?

???

# Plant Spacing

- Infra-red light bouncing off neighboring plants increases bulbing
- ***Thick Stands*** – increase rate of bulbing, time to mature = smaller bulb size
- ***Thinned Stands*** – bulb formation slowed, take longer to mature, more leaf growth = thick necks

# Plant Spacing

**W I D E plant spacing is favorable for bacterial decay:**

- ***Large plants, bushy leaves:*** hold water in leaf axils and whorls
  - Favor bacteria to entry into plant
- ***Thick necks:*** take longer to dry down, remain green and succulent
  - Bacteria spread from leaves into bulb
- ***Delayed maturity:*** interferes with proper lodging & curing of necks and bulbs
  - Bacteria spread from leaves into bulb

**Narrow plant spacing is less favorable for bacterial rots**

# Objective

To evaluate the effects of plant spacing on bacterial bulb decay, yield, bulb size and economic return in small-scale intensive onion production.

# 2009 Plant Spacing Trials

## Interlaken, NY

Onion Spacing Trial: New Holland, PA (Jul-16): Marketable Bulbs

# Results: Onion Spacing Trial – bulb size at harvest

Plant Spacing Trial, Interlaken, NY (Sep-14): Bulb Size

# Results: Onion Spacing Trial – economic return

## Variable Rate (PA)

- Small - \$0.20/lb
- Medium - \$0.40/lb
- Jumbo - \$0.50/lb
- Colossal - \$0.55/lb
- Cannot sell more than 30% small + medium
- **Cost of imported bare root transplants: \$0.02/plant**

## Uniform Rate (NY)

- \$0.90/lb
- Cannot sell smalls
- **Cost of locally grown plug transplants: \$0.03 per plant**

No. of transplants per 100 ft of bed	
4" x 4 rows	1200
4" x 3 rows	900
8" x 4 rows	600
10" x 4 rows	480
10" x 3 rows	360

# Results: Onion Spacing Trial – economic return

# Summary

- Wider plant spacing (i.e. 8 inches or more) results in:
  - Plants with more leaves and bushy top growth
  - thicker necks
  - Delayed or inhibited maturity
  - Bigger bulbs
  - **Increased bacterial bulb rots**
- **Reducing plant spacing from 8 inches to 4 inches reduced bacterial disease from 36% to 12%, a value of up to \$142 per 100 ft bed**

# Future Research

- Prove technique:
  - in different growing seasons (i.e. hot & dry)
  - different bacterial diseases (other than sour skin)
- Does the bolting issue repeat?
- Try 6 inch plant spacing in NY

  - *Burkholderia cepacia*

# Results: Onion Spacing Trial – total marketable yield

# Results: Onion Spacing Trial – bulb size at harvest

New Holland, PA: July 10, 2010

# Results: Onion Spacing Trial – economic return

# Results: Onion Spacing Trial Interlaken, 2010

# Results: Onion Spacing Trial % bacterial bulb rot at harvest

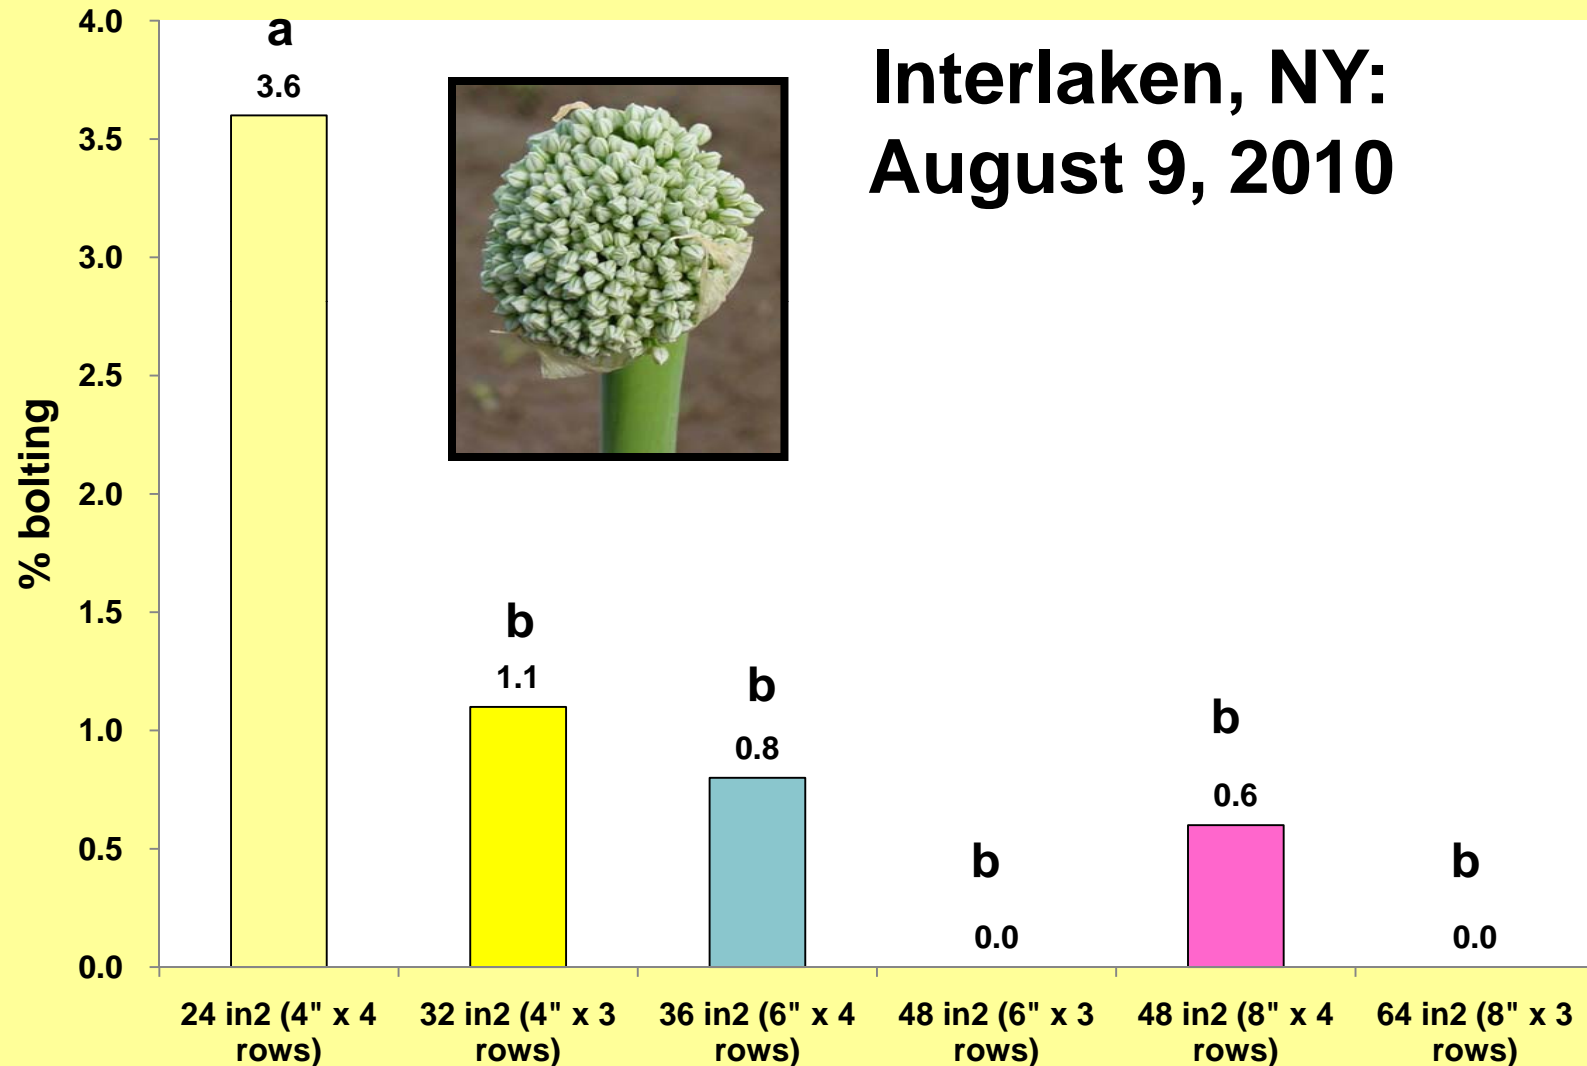

# Results: Onion Spacing Trial – total marketable yield

# Results: Onion Spacing Trial – % bolting

# Results: Onion Spacing Trial – bulb size at harvest

# Results: Onion Spacing Trial – economic return

# Summary

Compared to the standard spacing, narrow (4") plant spacing had:

- plants with fewer leaves, thinner necks that matured earlier
- Less bacterial bulb decay at harvest
  - 44-66% control
- Increased marketable yield due to increased jumbo weight, and higher economic return
- Be aware of higher small & medium weight and bolting with 4 rows per bed

# Recommendation

## 4" plant spacing, 3 rows per bed

- Reduced bacterial disease
- Increased yield, without risk of too many medium and small bulbs
- Reduced risk of bolting
- Grower specific

# **How Does Mulch Type Reduce Bacterial Decay?**

# Mulch Type

- Onion growth is favored by:
- moderate temperatures:
  - no growth below 43°F
  - no growth above 81°F
- Black plastic absorbs sunlight
  - Increase soil temperature
  - Promotes early crop growth in April & May

# Mulch Type

- During late-June, July, early-Aug, **black plastic** may be creating an environment that is
  - More favorable for bacterial growth
  - Less favorable for onion growth
- Daily high temperature at the soil line was 10 °F cooler in reflective silver mulch compared to black plastic (Reid, 2007)

# Mulch Type

## **Alternative Mulch Types:**

### **Reflective Metallic Silver Plastic:**

- Cooler temperatures in heat of summer are:
  - Less favorable for development of bacterial disease
  - More favorable for growing big bulbs
  - Possibly at the expense of early plant growth in the spring
- Repels onion thrips to a degree
  - Thrips feeding may provide entry sites for bacterial pathogens

# Mulch Type

## **Alternative Mulch Types:**

- **Bare ground (no mulch)**
  - Cooler temperatures than black plastic
  - Weed control more challenging
- **Biodegradable black plastic:**
  - compromise between black plastic and bare ground
  - black plastic giving a push to early season growth and then giving way to cooler soil temperatures as it degrades

# 2009 & 2010 Mulch Trials

Black plastic (std)

Metallic silver plastic  
with black stripe

Biodegradable black  
plastic

Bare ground

36 inch<sup>2</sup> per bulb: 4 rows per bed, 6 inch plant spacing

# Results: 2010 Mulch Trial

## Plant size

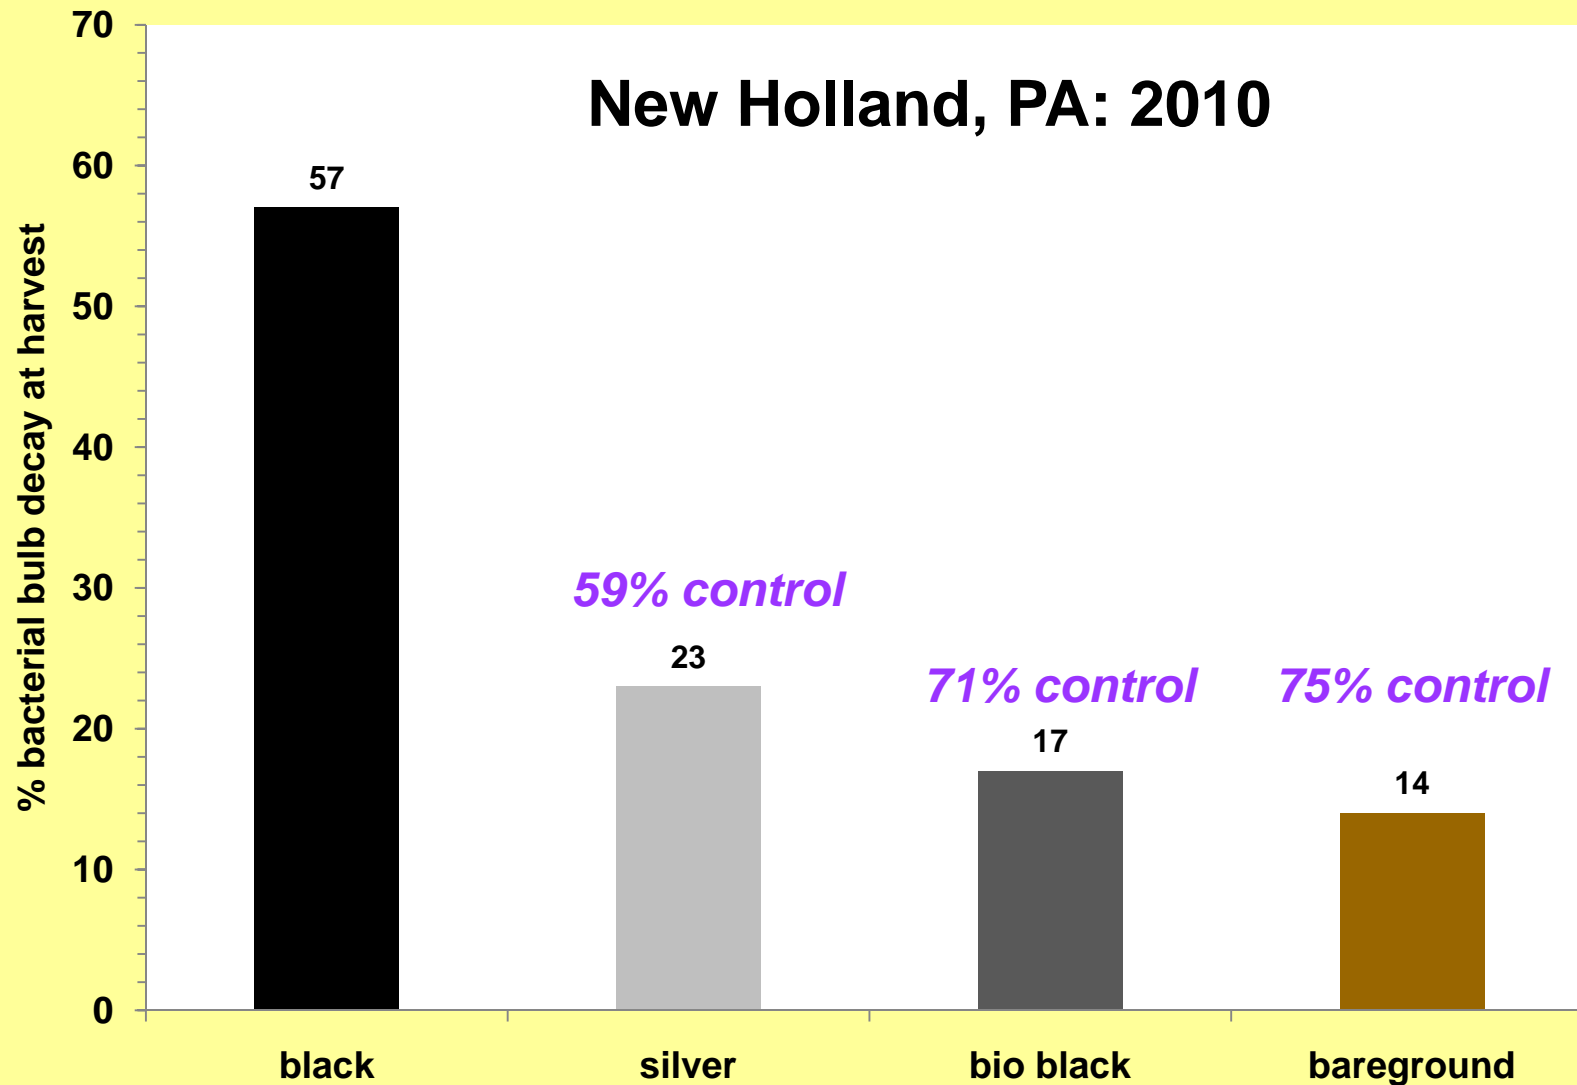

***New Holland, PA: July 20, 2010***

	No. leaves /plant	Neck diameter (inch)
Black (standard)	9.7	0.49 b
Silver	10.1	0.65 a
Black Biodegradable	10.4	0.63 a
Bare ground	9.9	0.61 a

## July 20, 2010

Biodegradable  
black

Bare ground

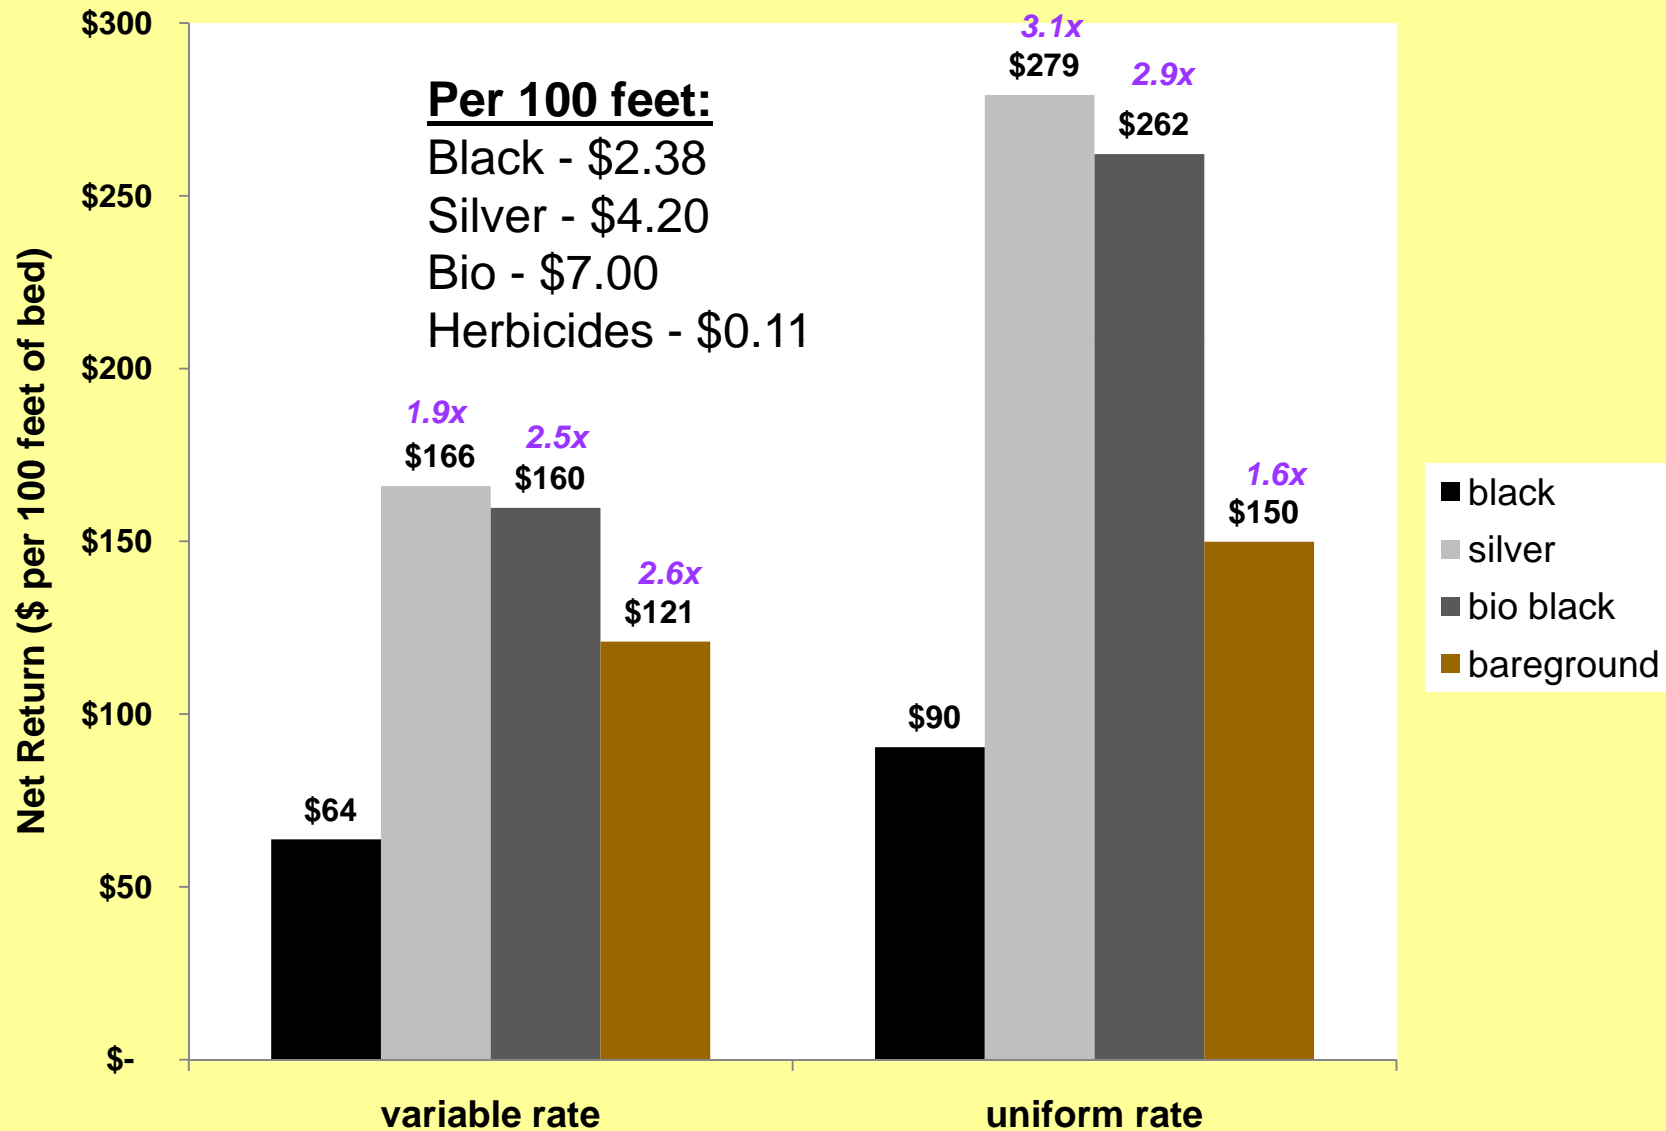

# Results: 2010 Mulch Trial Bulb Size

# Results: 2010 Mulch Trial Economic Return

# Summary

## Alternatives to black plastic:

- provided 59% to 75% control of bacterial bulb decay
- Had higher marketable yield and economic return
- Silver and biodegradable black plastic had higher jumbo weight
- Bare ground had significantly higher small and medium weight (weed competition)

**Black plastic needs to be replaced!**

## Next Steps

# STOP THE ROT!!

Demonstration and grower adoption of  
narrow plant spacing

# Next Steps

- Alternative mulches will be studied further to elucidate which performs the best during different growing seasons
- Mulch and narrow spacing combo studies
- Investigate relationship between nitrogen fertility and bacterial diseases
- Develop a comprehensive IPM program for bacterial diseases of onion

**The future is bright!**

# Questions?

**The most disgusting rotten onion I've ever seen!**
