

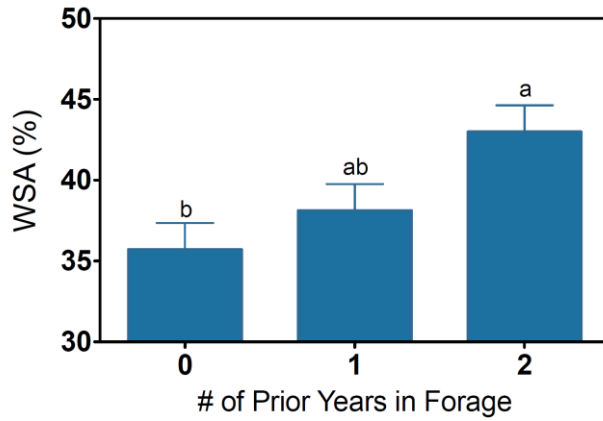

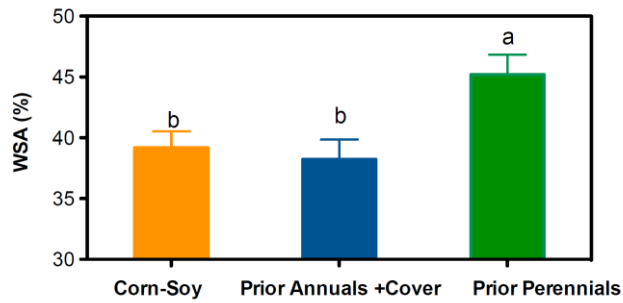

Fig. 1. Soil quality indicators measured at NESARE DCS site in corn crop entries four years after project initiation include: water stable aggregates (WSA) (A) with 0-2 years of forage beforehand and WSA (B) and soil organic matter (C) after corn and soy (Corn-Soy Rotation), after annuals and cover (Pest Rotation), and after perennials (Manure Rotation). Means are shown with SE and statistical significance indicated with a,b.
