- Soil health measurements need to be benchmarked based on cropping system
- Pasture typically has greater soil health values than annual crops, but little is known about variation
- Measurements of labile carbon and nitrogen are valuable soil health metrics that are cost-effective and responsive to management

- Objectives:**
1. Compare soil health indicators for conventional, annual cropping systems and pasture
  2. Evaluate how inherent soil properties influence soil health indicators of pastures
  3. Assess if pasture management can improve soil health values and what management practices are most beneficial to adopt

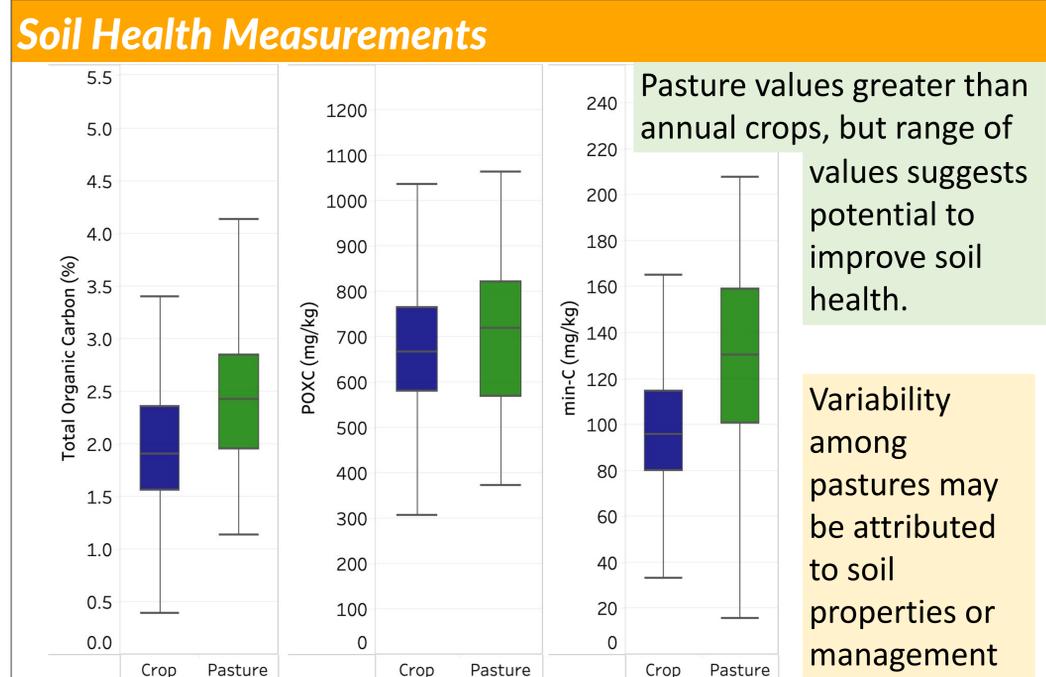

- 96 pastures
- sampled June 2021
- 0-15 cm; composite of 15 soil cores

**Key measurements:**  
**Chemical Extractions:** Permanganate oxidizable carbon (POXC), Autoclaved-citrate extractable protein (ACE)  
**Incubations:** Potentially mineralizable carbon (min-C), Potentially mineralizable nitrogen, 7-d anaerobic (PMN)

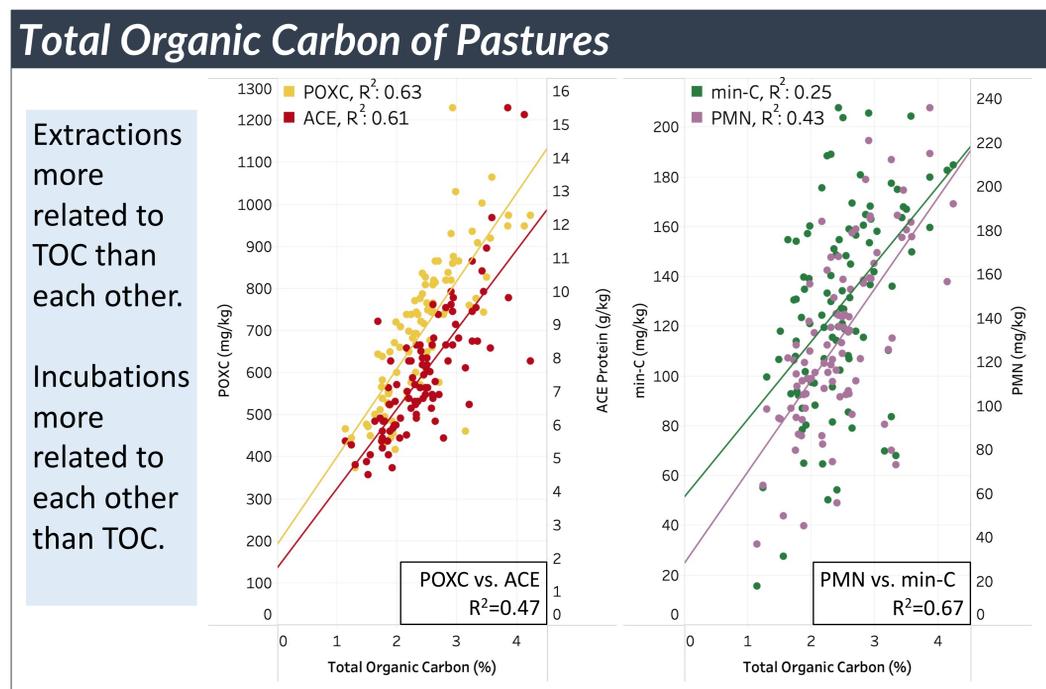

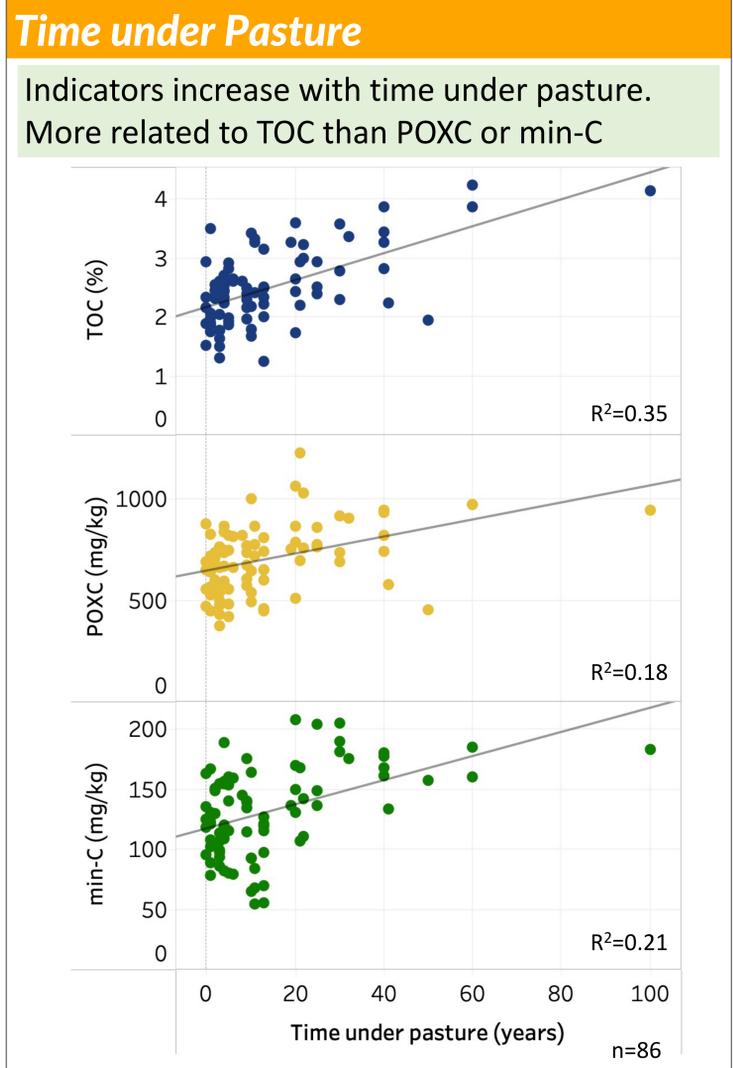

*Pastures have greater labile carbon and nitrogen pools than annual cropping systems. But among pastures, the variability in soil health indicators suggest that there is still capacity to improve.*

- Total organic carbon (TOC) is more related to chemical extractions (POXC, ACE) and soil texture is more related to incubations (min-C, PMN)
- Time under pasture associated with greater soil health values, but more related to TOC than POXC or min-C

### Soil Texture of Pastures

	R <sup>2</sup>		Extractions not related to soil texture; Incubations somewhat related
	% Sand	% Clay	
POXC	0.06	0.01*	*not significant at p < 0.05
ACE	0.01*	0.03*	
min-C	0.35	0.19	
PMN	0.30	0.12	

- ### Future Analysis
- Regression tree analysis and multivariate analysis
  - Explore relationships between management, soil health indicators and ecosystem services: productivity, greenhouse gas emissions, and carbon sequestration

- ### Other Management Factors to Consider
- Pasture composition:
    - Percent legumes had no effect on indicators
  - Intensity of grazing
  - Grazing management
  - Days since grazing at time of sampling
