

Figure 1 Difference in mean seedling recruitment based on category of native grass cover (%). Seeding treatments (non-seeded control, pellets with 1.5 parts clay, and pellets with 3 parts clay) are combined. Treatments were applied at two ranches in southwestern Montana. The dark central line of each boxplot represents the sample median. Black dots represent outliers that occur outside of the first and third quartiles of the data. Light gray dots represent raw data jittered horizontally for better visualization. Red asterisk indicates a statistically significant difference in seedling recruitment by native grass cover at $\alpha = 0.05$.
