

Figure 1. Sampling diagram of treatment (A&K and grower standard) blocks paired at commercial vineyards. Blocks were located at the edge of vineyards and were 0.2 hectare. Only point-source stations in the A&K treatment received dual *P. japonica* lures and weekly insecticide applications of carbaryl, no additional insecticide applications, and a buffer zone. The grower standard was managed entirely at the grower’s discretion with broadcast applications of broad-spectrum insecticides. Diagram represents key features, but is not to scale.
