

Figure 4. Total invertebrates (A), predators (B) and herbivores (C) collected from corn foliage at three plant stages from corn monocultures (open circles) and corn interseeded with cover crops (dark circles). Data presented are mean \pm SEM arthropods collected per corn plant from four fields at three locations (n = 12) Results of rm-ANOVAs are also presented ($\alpha = 0.05$) with significant findings denoted with an asterisk.
