

Figure 5: Changes in the height of bare root (no variety) pawpaw (*Asimina triloba*) outplanted in woodland plots in 2022 and monitored to 2025. Box corresponds to interquartile range (IQR: 25th and 75th percentiles), with center line as median. Whiskers extend from the box to the lowest value within $1.5 \times \text{IQR}$, with small circles representing outliers. Larger circles represent plot-level data. Letters indicate significant differences in plant height between years, determined from a one-way ANOVA.
