Mean (Tissue)									

^aCT = cluster thinning at E-L 31 (Coombe 1995); ELR-3 = 3 leaves removed at E-L 19; ELR-5 = 5 leaves removed at E-L 19

^bMain effects means followed by different letters are significantly different (Tukey's HSD test, $P < 0.10$).

^cDifferent lowercase letters indicate mean differences within each tissue for the treatment main effect (i.e., means between rows) at $P = 0.10$

^dDifferent uppercase letters indicate mean differences within each treatment for the tissue main effect (i.e., means between columns) at $P = 0.10$

^eNA: roots were not collected due to frozen soil
