Evaluation of new hybrid varieties with improved disease resistance, fruit quality and yield

Motivation

 Increase the profitability and sustainability of the MA cranberry industry

Performance data to be collected under MA growing conditions

 Aid decision making decision processes e.g. when applying for Cranberry Bog Renovation Grant Program

Project goals

- 1. Ease of establishment, time to full productivity and yield
- ✓ Characterize ease of establishment for new hybrids under MA growing conditions
- Assess bloom phenology, time to the reach full productivity and yield potential

2. Fruit quality

✓ Evaluate fruit quality in (fruit color, fruit firmness, internal quality, berry size, storage potential)

Project goals

- 3. <u>Disease management (Leela Uppala)</u>
- Document fruit rot resistance and susceptibility
- ✓ Document the incidence (if any) of other diseases such as phytophthora root rot and upright dieback on new cultivars

4. Weed management (Hilary Sandler and Katie Ghantous)

- Document the susceptibility of to damage from herbicides currently used in MA
- Evaluate the ability to outcompete weed species that are predominant in newly renovated cranberry bogs in MA

Project goals

5. Insect management and pollination (Anne Averill)

 Document susceptibility to insect pests and attractiveness to pollinators

Frost tolerance (Peter Jeranyama)

 Document the frost tolerance and classify them accordingly

Rutgers varieties

- 5 varieties
- Disease resistance, high yielding, early ripening, good fruit color, large fruit size, lower acidity

Valley Corp Varieties

- 5 varieties
- ➤ High yielding, large fruit size, good fruit color, excellent rebud and fresh fruit keeping quality

University of Wisconsin – Madison Varieties

- 3 varieties
- Strong yearly growth and bud sets, high yields, large fruit quality, fertilizer tolerance, early maturity

Project partners

Keith Mann (partner farmer)

Juan Zalapa

Ed Grygleski, Nicole Hansen & Abbott Lee
