

Figure 24. Effect of mowing medusahead one year after application of mowing treatment (Dunningan Hills, California). The area on the left was mowed when medusahead was in stage R6 in 2007, whereas the area on the right was left intact. The area mowed has 5-10% medusahead cover whereas the control area has >50% medusahead cover. The mowed area was dominated by filaree and rose clover. Photo was taken at stage R5 in 2008.

Figure 25. Effect of mowing on medusahead cover at the Dunninga Hills, California. The foreground bottom horizontal band shows a control area. The middle band shows the area mowed in 2007. Top band shows area recently mowed in 2008. Photo taken in May 2008.
