

Figure 7. The bar graph shows the mean number of fly pupae eaten per beetle over two days for species included in the feeding trial. Error bars are the standard error of the mean. Species labeled with different letters were significantly different based on Tukey’s HSD multiple comparison test. The points indicate the mean length of female individuals of each species. Species that ate fewer fly pupae than would be expected based on their length are indicated with triangles, diamonds represent the rest of the species.
