Figure 1. Effects of pesticide seed treatment on soil meso- and macrofaunal community composition (2013). Non-metric multidimensional scaling was used to visualize these data (Distance measure: BC-Sorensen; Stress: 9.76482). (a) Community composition grouped by treatment for all samples throughout the growing season. (b) Community composition grouped by sampling time. A correlation biplot identifies the taxa most associated with each sampling time ($r^2 = 0.300$).
