

Figure 1. Total activity-densities of the most frequently captured predatory groups in corn and soybean treatments, with a standing crop of hairy vetch and triticale (HVT) in corn, and rye in soybean (a.); and wheat (b.). Activity-densities for the corn and soybean treatments represent the sum total prior to cover crop management (HVT and rye, respectively), with three dates of pitfall trapping combined. All wheat pitfall trapping occurred simultaneously. Taxonomic groups with fewer than 15 individuals are not shown (n=16 for all treatments but wheat, for which n=48).
