

Figure 3: The average biomass of each species in the native and ruderal seed mixes when grown in a greenhouse experiment. Triticale produced the most biomass of all the species. In the native mix, green needlegrass and bluebunch wheatgrass productivity was the same. Triangles represent the mean, and error bars were constructed using the standard error. Species/treatments labeled with the same letters were not statistically different from one another using an alpha level of 0.05 and Tukey's Honestly Significant Difference pairwise comparison test.
