

Controlled Environment Greenhouse Study: Nitrate Availability

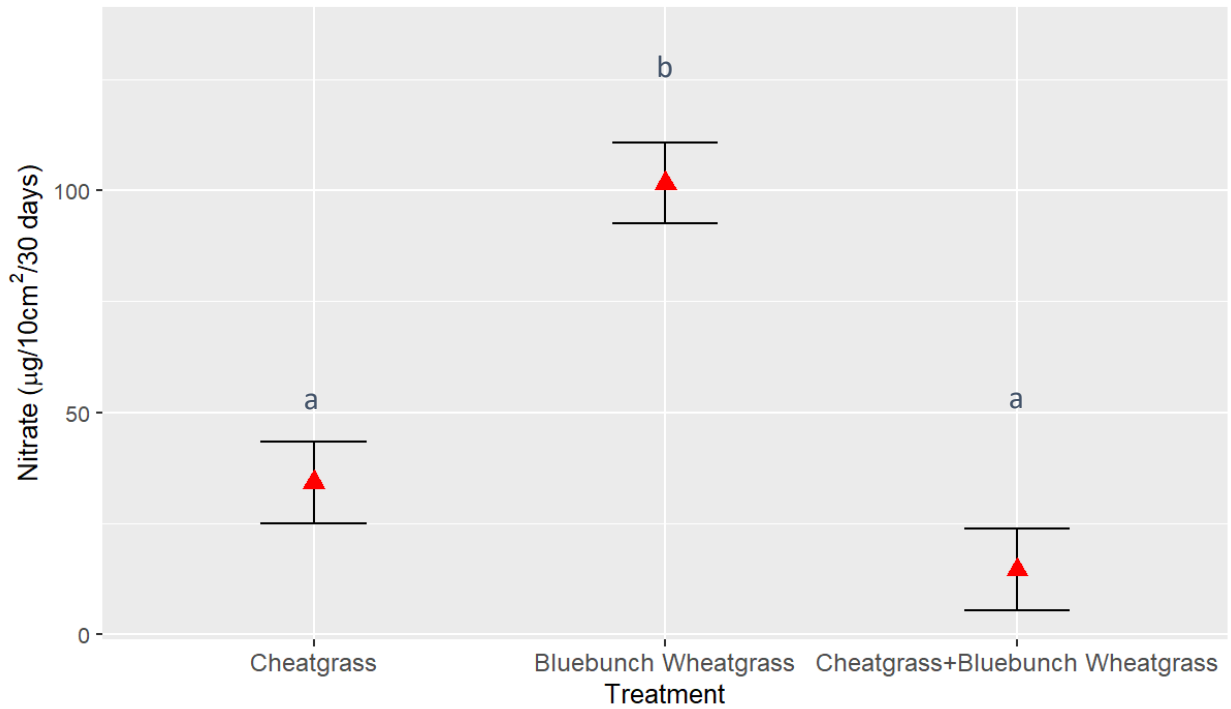

Figure 7: Available nitrate (NO₃) in pots containing cheatgrass alone, bluebunch wheatgrass alone, and cheatgrass and bluebunch wheatgrass grown together for 30 days in a greenhouse experiment. There was less nitrate available in pots containing cheatgrass. Triangles are the mean; error bars are constructed using standard errors. Species/treatments labeled with the same letter are not statistically different from one another using an alpha level of 0.05 and a Tukey's Honestly Significant Difference pairwise comparison test.
