

Figure 8 - Left: Percentage of cover crop residue remaining measured in both cover crop treatments at removal dates (circles) and predictions from non-linear models in the 2019 (upper left) and 2020 (bottom left) growing season. Right: Cumulative percentage of N released from the cover residue measured in both cover crop treatments at removal dates (circles) and predictions from non-linear models for the 2019 (upper right) and 2020 growing season (bottom right). Ribbons around predictions indicate the prediction standard error.
